

Getting Started with MCUXpresso SDK for LPC51U68

1 Overview

The MCUXpresso Software Development Kit (SDK) provides comprehensive software support for Kinetis and LPC Microcontrollers. The MCUXpresso SDK includes a flexible set of peripheral drivers designed to speed up and simplify development of embedded applications. Along with the peripheral drivers, the MCUXpresso SDK provides an extensive and rich set of example applications covering everything from basic peripheral use case examples to full demo applications. The MCUXpresso SDK contains FreeRTOS, a USB host and device stack, and various other middleware to support rapid development.

For supported toolchain versions, see the MCUXpresso SDK Release Notes Supporting LPCXpresso51U68 (document MCUXSDKLPC51U68RN).

For the latest version of this and other MCUXpresso SDK documents, see the MCUXpresso SDK homepage [MCUXpresso-SDK: Software Development Kit for MCUXpresso](#).

2 MCUXpresso SDK Board Support Folders

MCUXpresso SDK board support provides example applications for NXP development and evaluation boards for Arm[®] Cortex[®]-M cores, including Freedom, Tower System, and LPCXpresso boards. Board support packages are found inside of the top level boards folder, and each supported board has its own folder (an MCUXpresso SDK package can support multiple boards). Within each <board_name> folder, there are various sub-folders to classify the type of examples they contain. These include (but are not limited to):

- cmsis_driver_examples: Simple applications intended to concisely illustrate how to use CMSIS drivers.
- demo_apps: Full-featured applications intended to highlight key functionality and use cases of the target MCU. These applications typically use multiple MCU peripherals and may leverage stacks and middleware.
- driver_examples: Simple applications intended to concisely illustrate how to use the MCUXpresso SDK’s peripheral drivers for a single use case. These applications typically only use a single peripheral, but there are cases where multiple are used (for example, SPI conversion using DMA).
- emwin_examples: Applications that use the emWin GUI widgets.
- rtos_examples: Basic FreeRTOS[™] OS examples showcasing the use of various RTOS objects (semaphores, queues, and so on) and interfacing with the MCUXpresso SDK’s RTOS drivers
- usb_examples: Applications that use the USB host/device/OTG stack.

2.1 Example Application Structure

This section describes how the various types of example applications interact with the other components in the MCUXpresso SDK. To get a comprehensive understanding of all MCUXpresso SDK components and folder structure, see the *MCUXpresso SDK API Reference Manual* document (MCUXSDKAPIRM).

Each <board_name> folder in the boards directory contains a comprehensive set of examples that are relevant to that specific piece of hardware. We’ll discuss the hello_world example (part of the demo_apps folder), but the same general rules apply to any type of example in the <board_name> folder.

In the `hello_world` application folder you see the following contents:

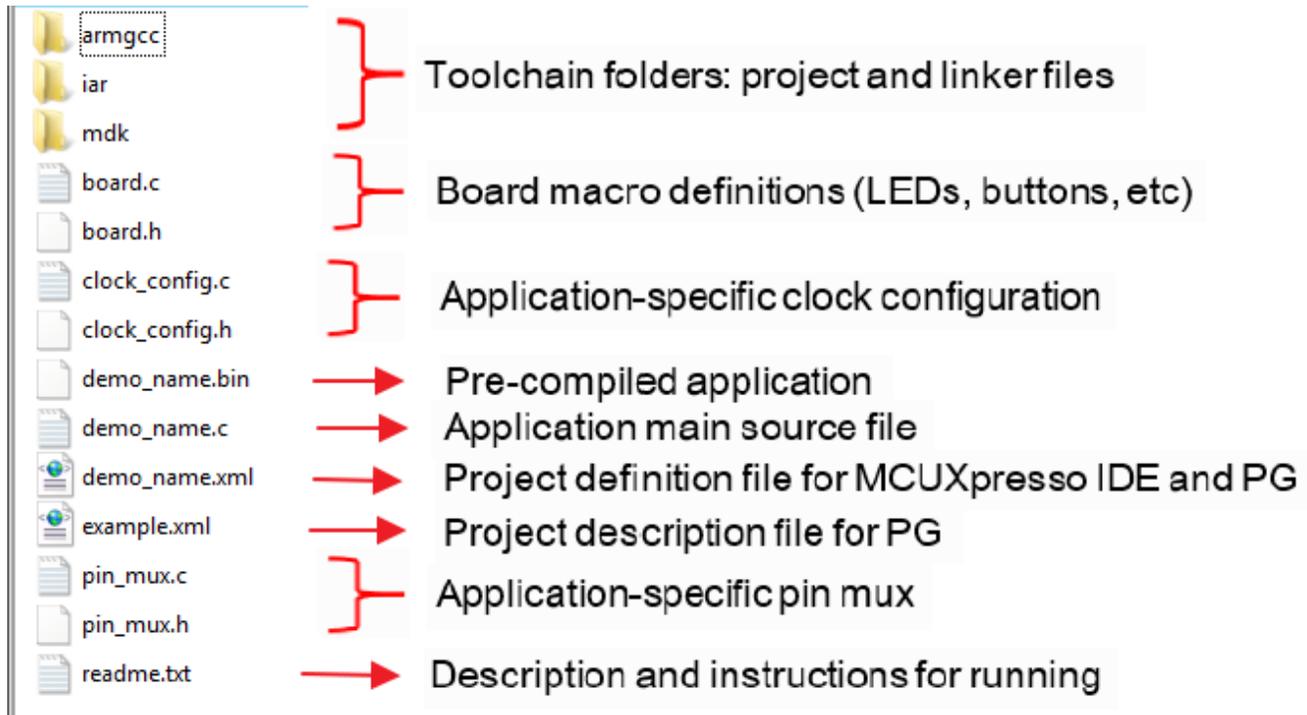

Figure 2. Application folder structure

All files in the application folder are specific to that example, so it is easy to copy and paste an existing example to start developing a custom application based on a project provided in the MCUXpresso SDK.

2.2 Locating Example Application Source Files

When opening an example application in any of the supported IDE (except MCUXpresso IDE), there are a variety of source files referenced. The MCUXpresso SDK devices folder is the central component to all example applications. It means the examples reference the same source files and, if one of these files is modified, it could potentially impact the behavior of other examples.

The main areas of the MCUXpresso SDK tree used in all example applications are:

- `devices/<device_name>`: The device's CMSIS header file, MCUXpresso SDK feature file and a few other things.
- `devices/<device_name>/cmsis_drivers`: All the CMSIS drivers for your specific MCU.
- `devices/<device_name>/drivers`: All of the peripheral drivers for your specific MCU.
- `devices/<device_name>/<tool_name>`: Toolchain-specific startup code. Vector table definitions are here.
- `devices/<device_name>/utilities`: Items such as the debug console that are used by many of the example applications.

For examples containing an RTOS, there are references to the appropriate source code. RTOSes are in the `rtos` folder. Again, the core files of each of these are shared, so modifying them could have potential impacts on other projects that depend on them.

3 Run a demo application using IAR

This section describes the steps required to build, run, and debug example applications provided in the MCUXpresso SDK. The hello_world demo application targeted for the LPCXpresso51U68 hardware platform is used as an example, although these steps can be applied to any example application in the MCUXpresso SDK.

3.1 Build an example application

The following steps guide you through opening the hello_world example application. These steps may change slightly for other example applications as some of these applications may have additional layers of folders in their path.

1. If not already done, open the desired demo application workspace. Most example application workspace files can be located using the following path:

<install_dir>/boards/<board_name>/<example_type>/<application_name>/iar

Using the LPCXpresso51U68 hardware platform as an example, the hello_world workspace is located in

<install_dir>/boards/lpcxpresso51U68/demo_apps/hello_world/iar/hello_world.eww

2. Select the desired build target from the drop-down. For this example, select the “hello_world – Debug” target.

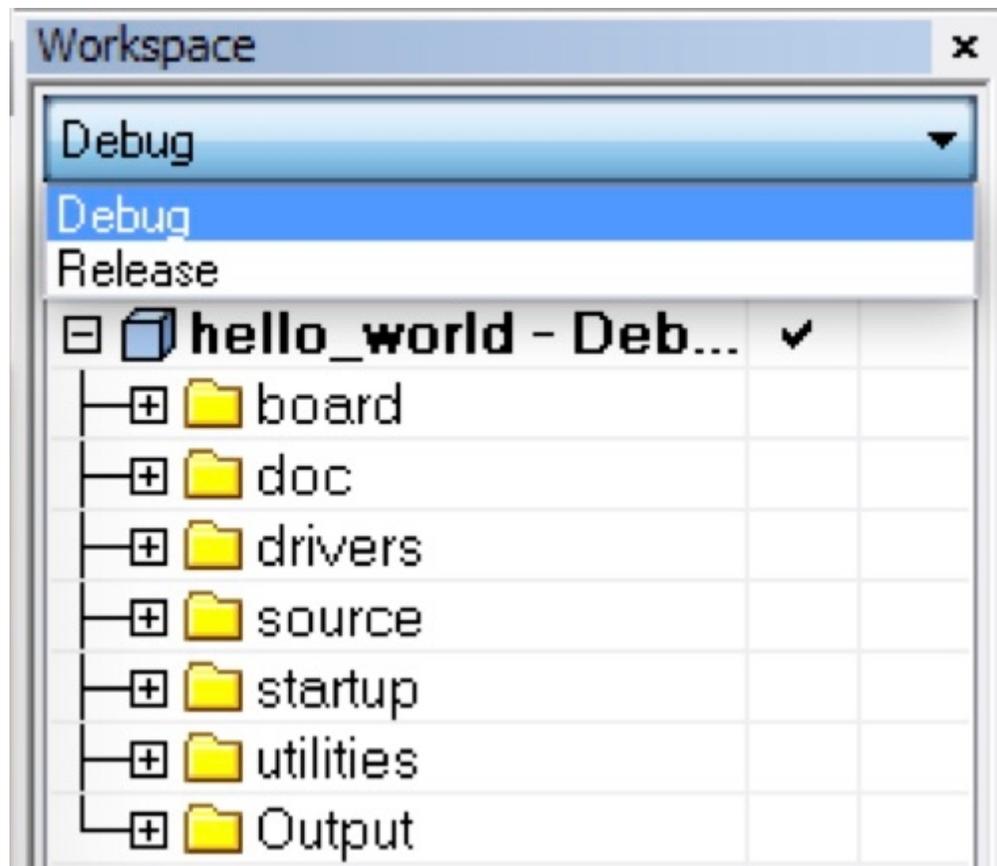

Figure 3. Demo build target selection

3. To build the demo application, click the “Make” button, highlighted in red below.

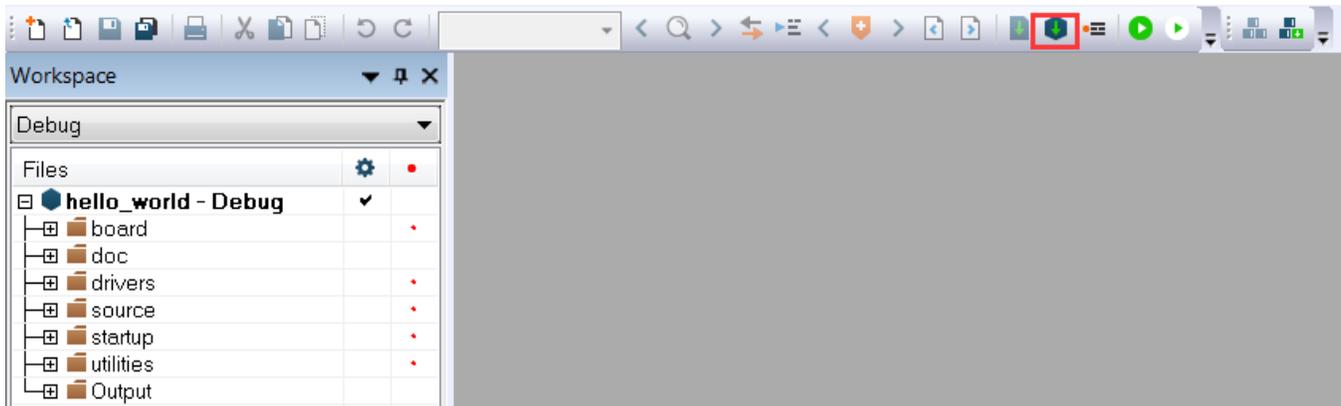

Figure 4. Build the demo application

4. The build completes without errors.

3.2 Run an example application

Run a demo application using IAR

To download and run the application, perform these steps:

1. Download and install LPCScript or the Windows® operating systems driver for LPCXpresso boards from www.nxp.com/lpcutilities. This installs the required drivers for the board.
2. Connect the development platform to your PC via USB cable between the Link2 USB connector (named Link for some boards) and the PC USB connector. If you are connecting for the first time, allow about 30 seconds for the devices to enumerate.
3. Open the terminal application on the PC, such as PuTTY or TeraTerm, and connect to the debug COM port (to determine the COM port number, see Appendix A). Configure the terminal with these settings:
 - a. 115200 baud rate (reference BOARD_DEBUG_UART_BAUDRATE variable in board.h file)
 - b. No parity
 - c. 8 data bits
 - d. 1 stop bit

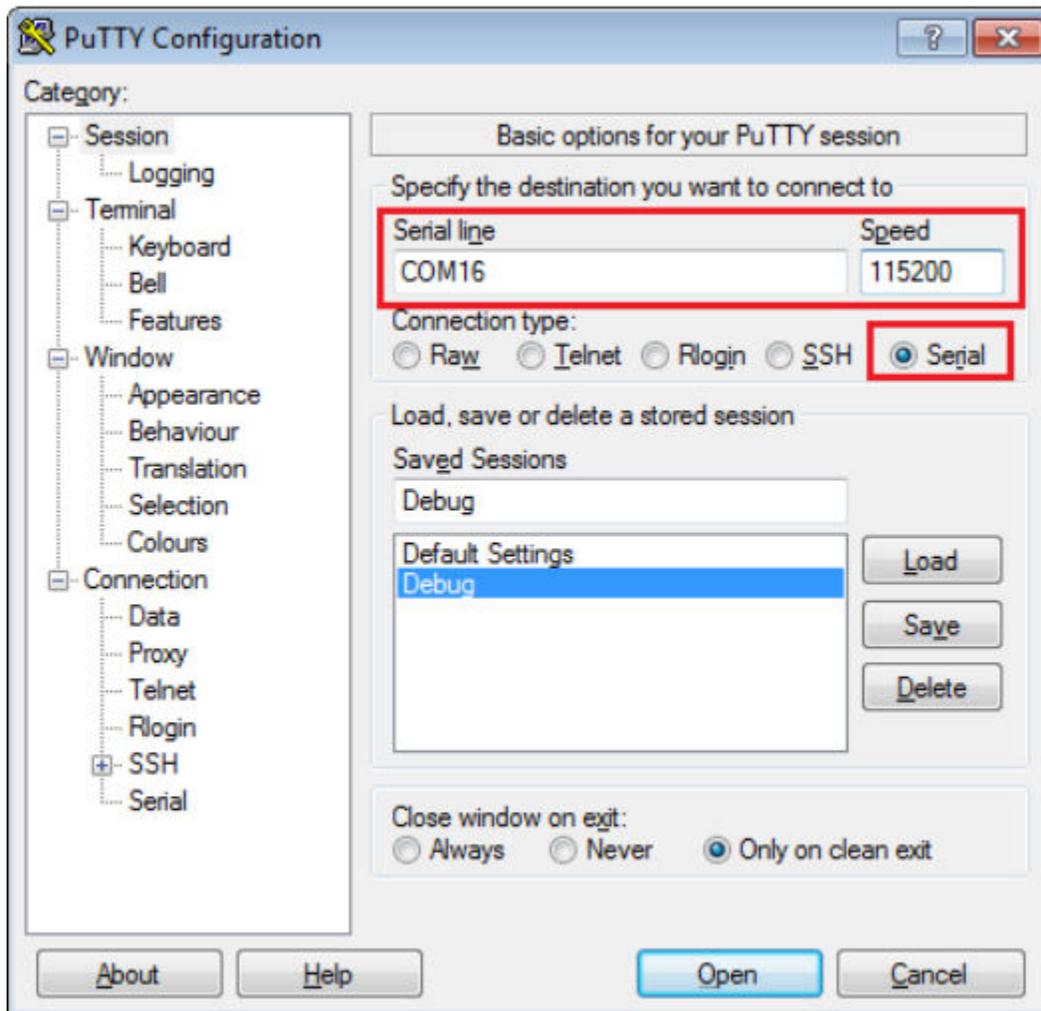

Figure 5. Terminal (PuTTY) configuration

4. In IAR, click the "Download and Debug" button to download the application to the target.

Figure 6. Download and Debug button

5. The application is then downloaded to the target and automatically runs to the main() function.

NOTE

The application is programmed to the external on board flash, then jumped to SRAM to run

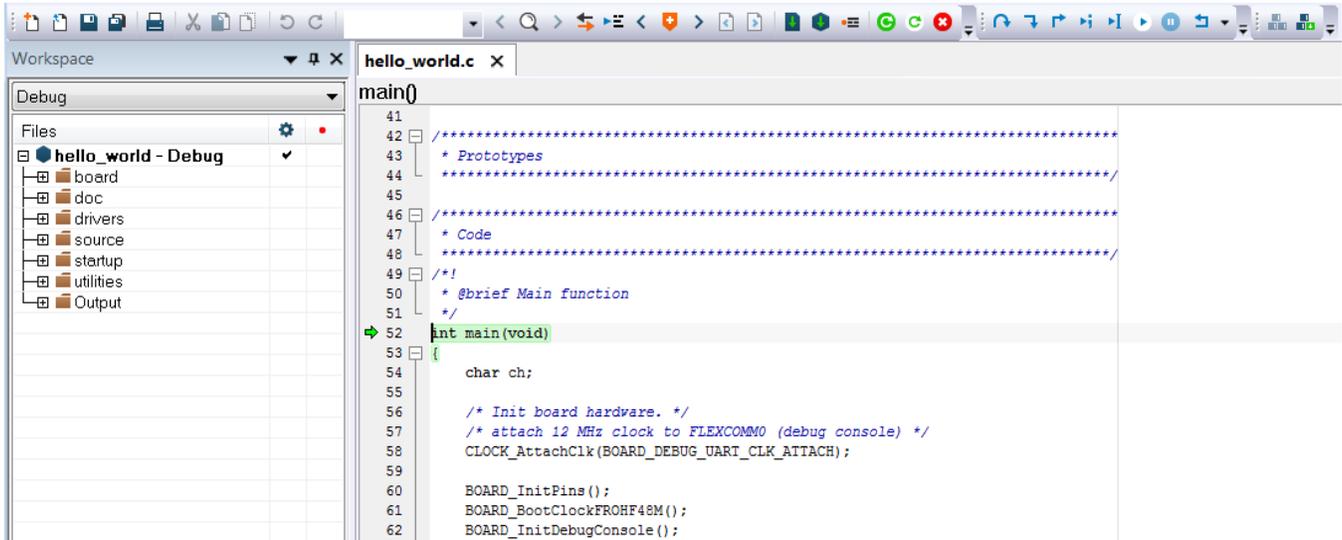

Figure 7. Stop at main() when running debugging

6. Run the code by clicking the "Go" button to start the application.

Figure 8. Go button

7. The hello_world application is now running and a banner is displayed on the terminal. If this does not occur, check your terminal settings and connections.

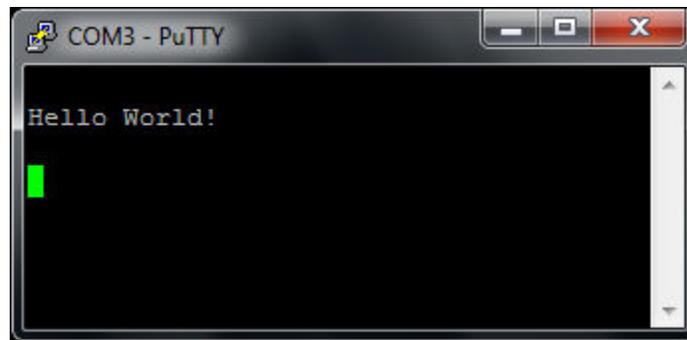

Figure 9. Text display of the hello_world demo

4 Run a demo using Keil® MDK/μVision

This section describes the steps required to build, run, and debug example applications provided in the MCUXpresso SDK. The hello_world demo application targeted for the LPCXpresso51U68 hardware platform is used as an example, although these steps can be applied to any demo or example application in the MCUXpresso SDK.

4.1 Install CMSIS device pack

After the MDK tools are installed, Cortex® Microcontroller Software Interface Standard (CMSIS) device packs must be installed to fully support the device from a debug perspective. These packs include things such as memory map information, register definitions and flash programming algorithms. Follow these steps to install the appropriate CMSIS pack.

1. Open the MDK IDE, which is called μVision. In the IDE, select the “Pack Installer” icon.

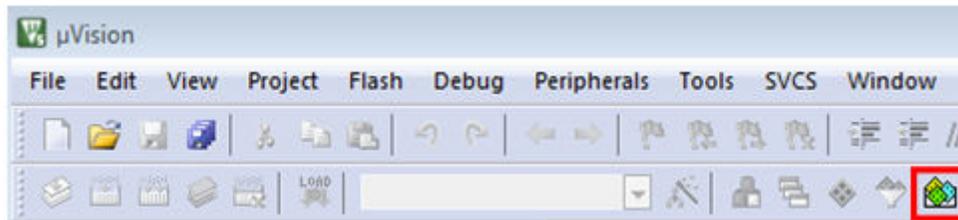

Figure 10. Launch the Pack installer

2. After the installation finishes, close the Pack Installer window and return to the μVision IDE.

4.2 Build an example application

- Open the desired example application workspace in: `<install_dir>/boards/<board_name>/<example_type>/<application_name>/mdk`

The workspace file is named `<demo_name>.uvmpw`, so for this specific example, the actual path is:

`<install_dir>/boards/lpcxpresso51U68/demo_apps/hello_world/mdk/hello_world.uvmpw`

- To build the demo project, select the "Rebuild" button, highlighted in red.

Figure 11. Build the demo

- The build completes without errors.

4.3 Run an example application

To download and run the application, perform these steps:

1. Download and install LPCScript or the Windows® operating systems driver for LPCXpresso boards from www.nxp.com/lpcutilities. This installs the required drivers for the board.
2. Connect the development platform to your PC via USB cable between the Link2 USB connector and the PC USB connector. If you are connecting for the first time, allow about 30 seconds for the devices to enumerate.
3. Open the terminal application on the PC, such as PuTTY or TeraTerm, and connect to the debug serial port number (to determine the COM port number, see Appendix A). Configure the terminal with these settings:
 - a. 115200 baud rate (reference `BOARD_DEBUG_UART_BAUDRATE` variable in `board.h` file)
 - b. No parity
 - c. 8 data bits
 - d. 1 stop bit

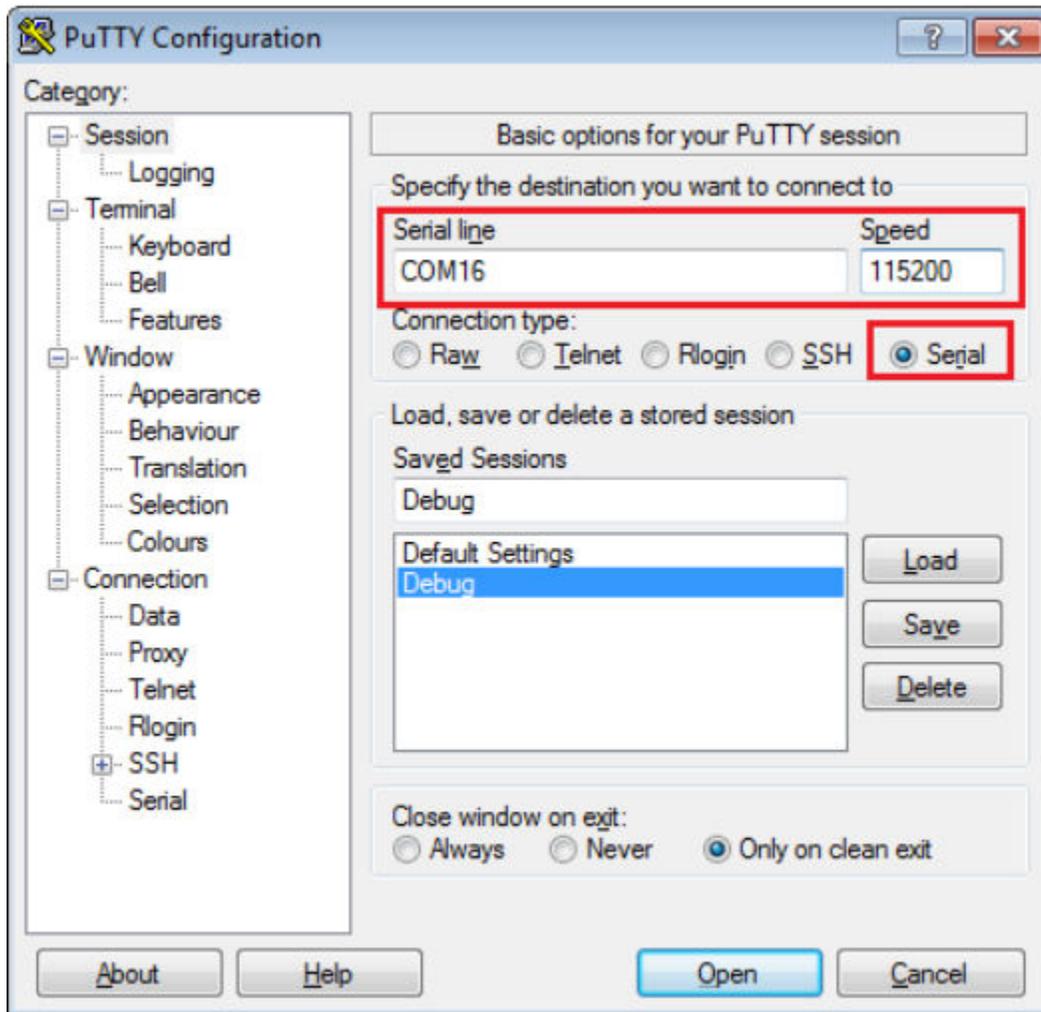

Figure 12. Terminal (PuTTY) configurations

4. To debug the application, click the “Start/Stop Debug Session” button, highlighted in red.

Run a demo using Keil® MDK/μVision

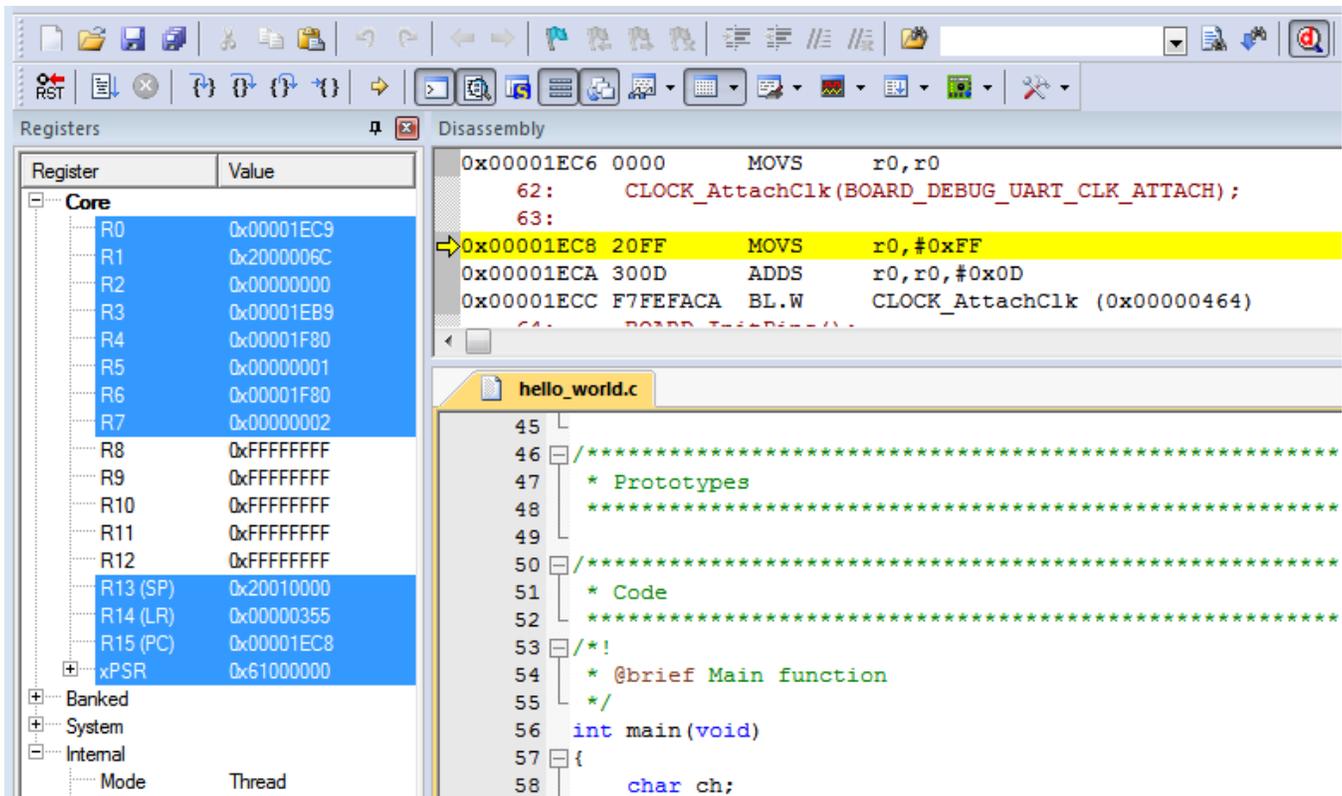

Figure 13. Stop at main() when run debugging

5. Run the code by clicking the “Run” button to start the application.

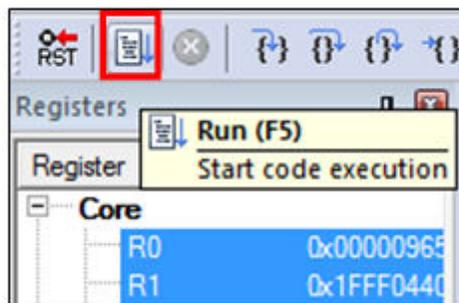

Figure 14. Go button

The `hello_world` application is now running and a banner is displayed on the terminal. If this is not true, check your terminal settings and connections.

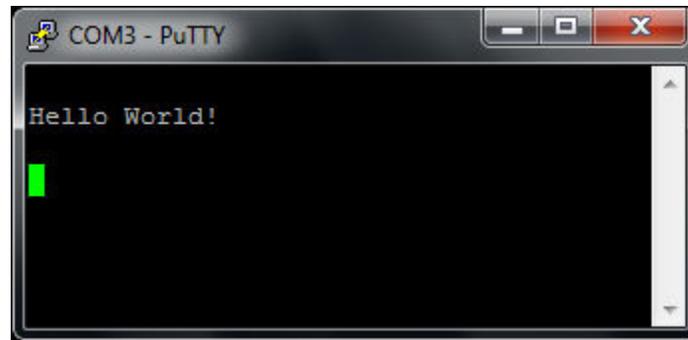

Figure 15. Text display of the hello_world demo

5 Run a demo using Arm® GCC

This section describes the steps to configure the command line Arm® GCC tools to build, run, and debug demo applications and necessary driver libraries provided in the MCUXpresso SDK. The hello_world demo application targeted for the LPCXpresso51U68 hardware platform is used as an example, though these steps can be applied to any board, demo or example application in the MCUXpresso SDK.

5.1 Set up toolchain

This section contains the steps to install the necessary components required to build and run a MCUXpresso SDK demo application with the Arm GCC toolchain, as supported by the MCUXpresso SDK. There are many ways to use Arm GCC tools, but this example focuses on a Windows operating system environment.

5.1.1 Install GCC ARM Embedded tool chain

Download and run the installer from launchpad.net/gcc-arm-embedded. This is the actual toolset (in other words, compiler, linker, etc.). The GCC toolchain should correspond to the latest supported version, as described in the *MCUXpresso SDK Release Notes Supporting LPCXpresso51U68*. (document MCUXSDKLPC51U68RN).

5.1.2 Install MinGW (only required on Windows OS)

The Minimalist GNU for Windows (MinGW) development tools provide a set of tools that are not dependent on third party C-Runtime DLLs (such as Cygwin). The build environment used by the SDK does not utilize the MinGW build tools, but does leverage the base install of both MinGW and MSYS. MSYS provides a basic shell with a Unix-like interface and tools.

1. Download the latest MinGW mingw-get-setup installer from sourceforge.net/projects/mingw/files/Installer/.
2. Run the installer. The recommended installation path is C:\MinGW, however, you may install to any location.

NOTE

The installation path cannot contain any spaces.

3. Ensure that the “mingw32-base” and “msys-base” are selected under Basic Setup.

Run a demo using Arm® GCC

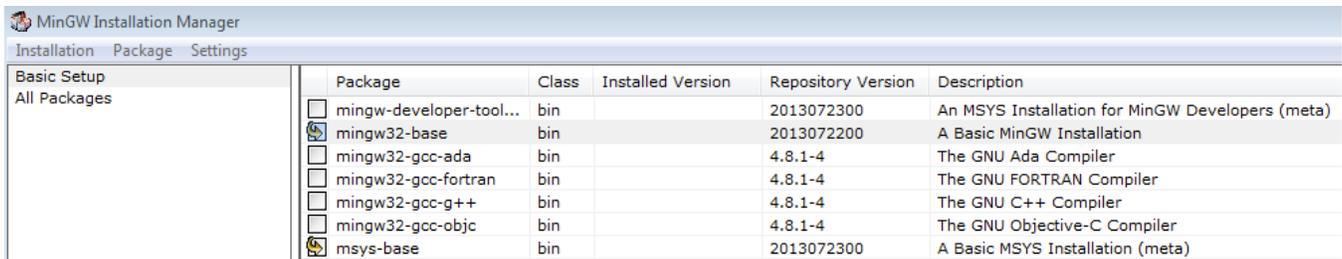

Figure 16. Setup MinGW and MSYS

- Click “Apply Changes” in the “Installation” menu and follow the remaining instructions to complete the installation.

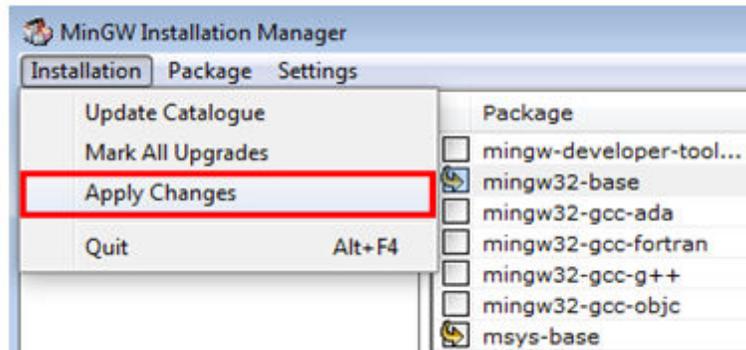

Figure 17. Complete MinGW and MSYS installation

- Add the appropriate item to the Windows operating system path environment variable. It can be found under *Control Panel -> System and Security -> System -> Advanced System Settings* in the "Environment Variables..." section. The path is:

`<mingw_install_dir>\bin`

Assuming the default installation path, C:\MinGW, an example is shown below. If the path is not set correctly, the toolchain does not work.

NOTE

If you have "C:\MinGW\msys\x.x\bin" in your PATH variable (as required by KSDK 1.0.0), remove it to ensure that the new GCC build system works correctly.

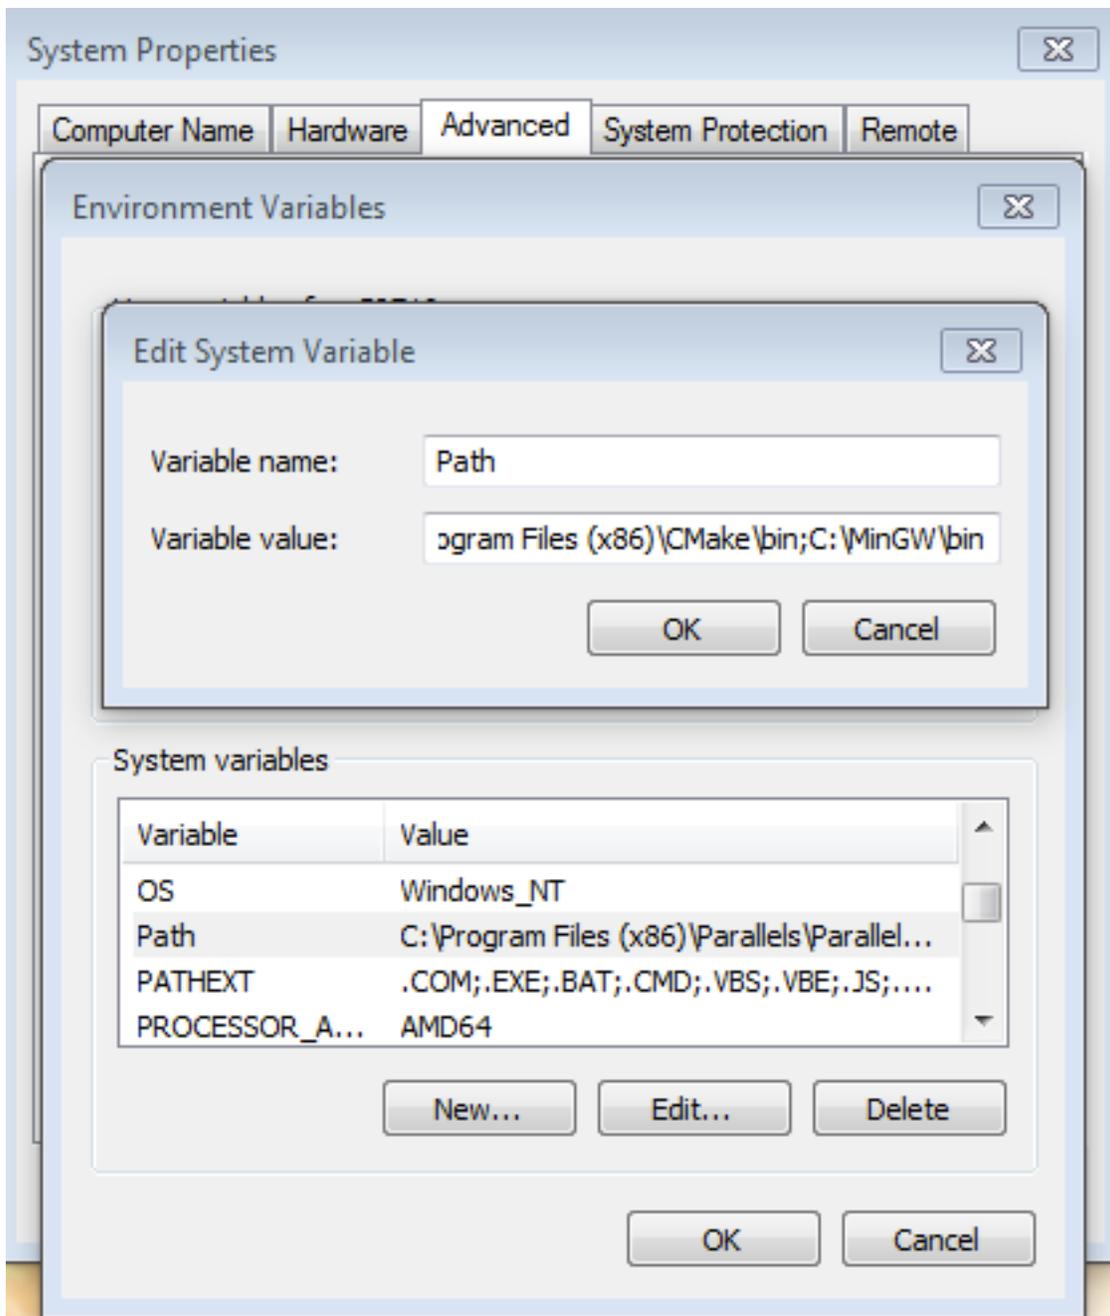

Figure 18. Add Path to systems environment

5.1.3 Add a new system environment variable for ARMGCC_DIR

Create a new *system* environment variable and name it ARMGCC_DIR. The value of this variable should point to the Arm GCC Embedded tool chain installation path. For this example, the path is:

Reference the installation folder of the GNU ARM GCC Embedded tools for the exact path name of your installation.

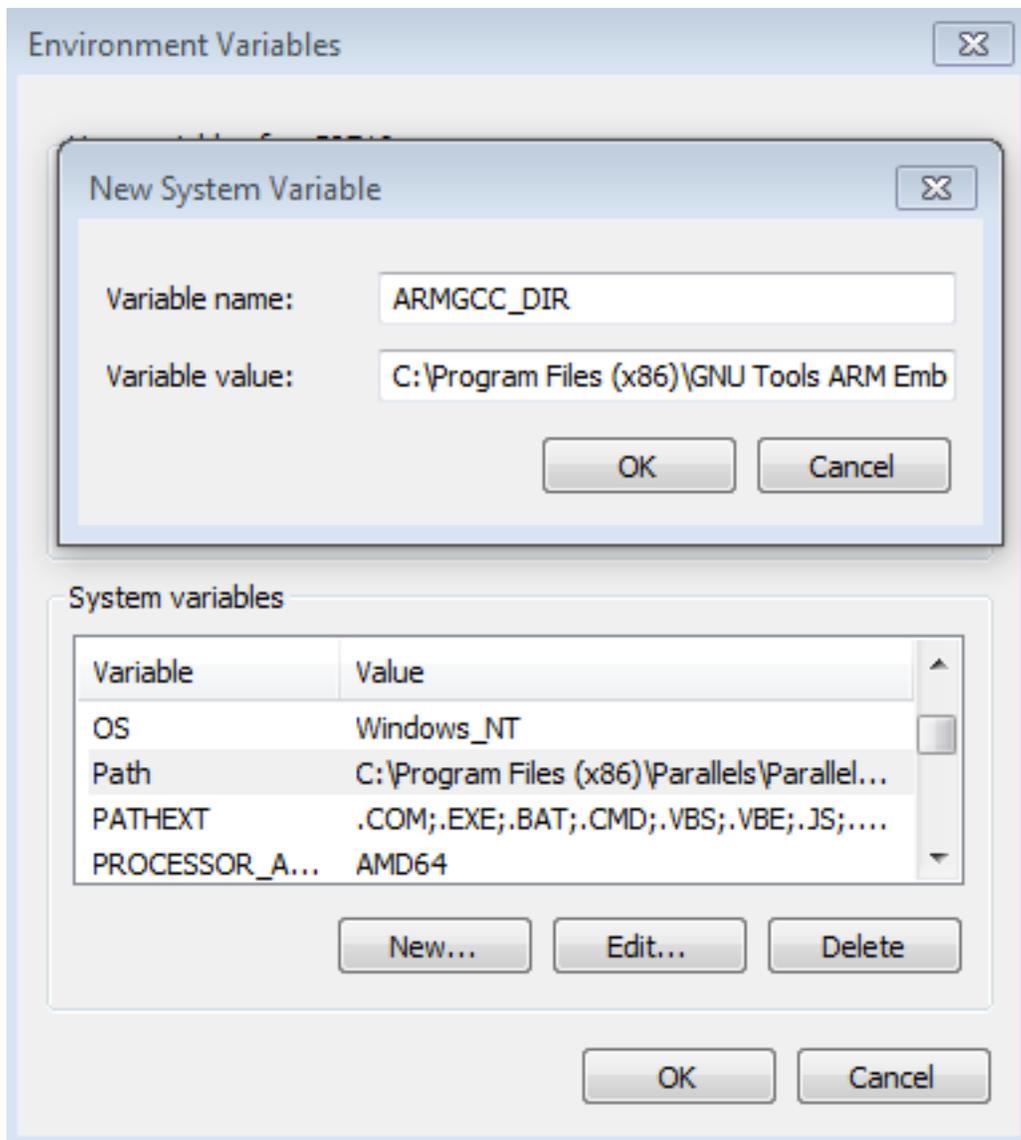

Figure 19. Add ARMGCC_DIR system variable

5.1.4 Install CMake

1. Download CMake 3.0.x from www.cmake.org/cmake/resources/software.html.
2. Install CMake, ensuring that the option "Add CMake to system PATH" is selected when installing. The user chooses to select whether it is installed into the PATH for all users or just the current user. In this example, it is installed for all users.

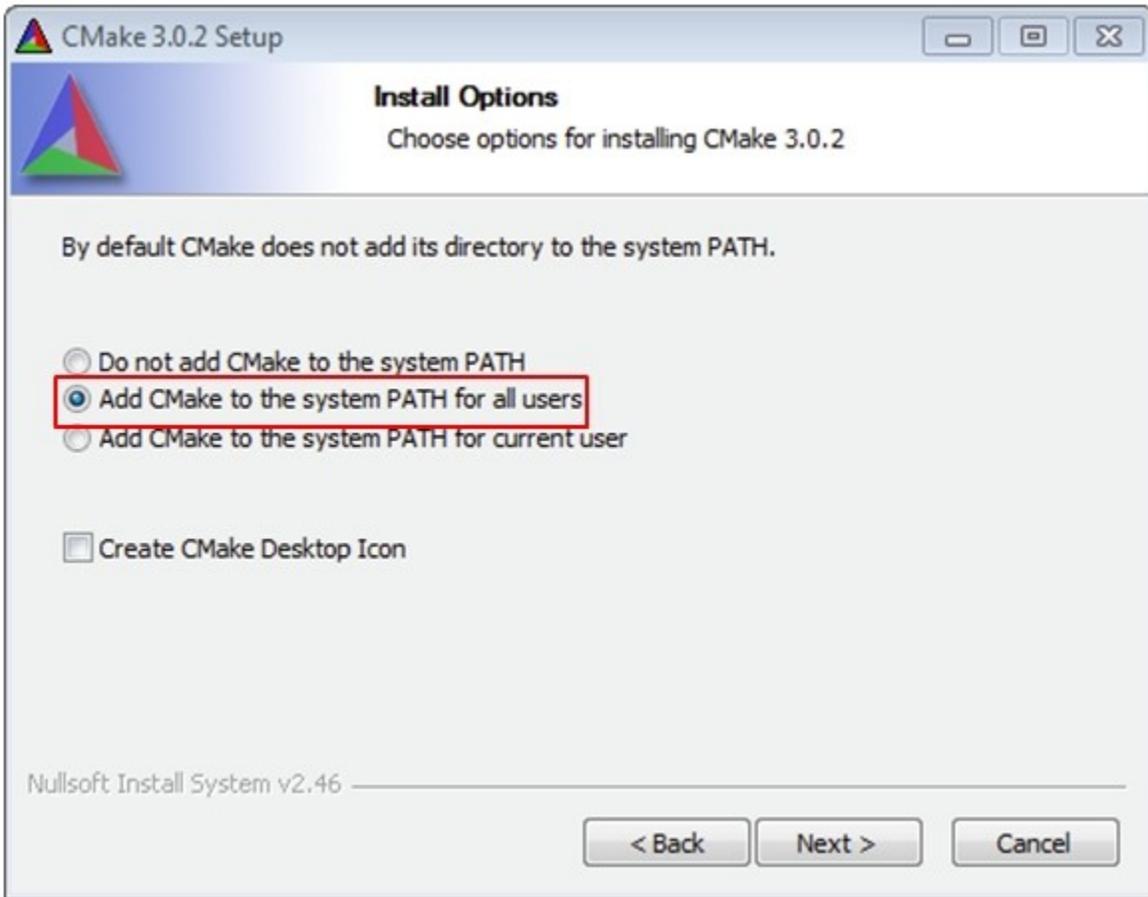

Figure 20. Install CMake

3. Follow the remaining instructions of the installer.
4. You may need to reboot your system for the PATH changes to take effect.
5. Make sure "sh.exe" is not in the Environment Variable PATH. This is a limitation of mingw32-make.

5.2 Build an example application

To build an example application, follow these steps.

1. Open a GCC Arm Embedded tool chain command window. To launch the window, from the Windows operating system Start menu, go to "Programs -> GNU Tools ARM Embedded <version>" and select "GCC Command Prompt".

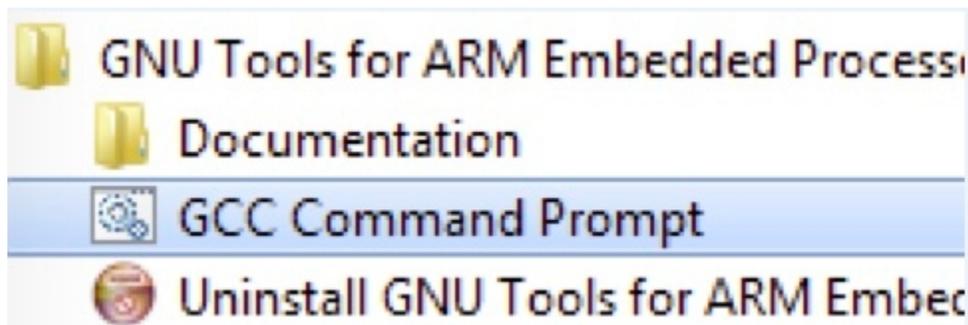

Figure 21. Launch command prompt

Run a demo using Arm® GCC

2. Change the directory to the example application project directory, which has a path similar to the following:

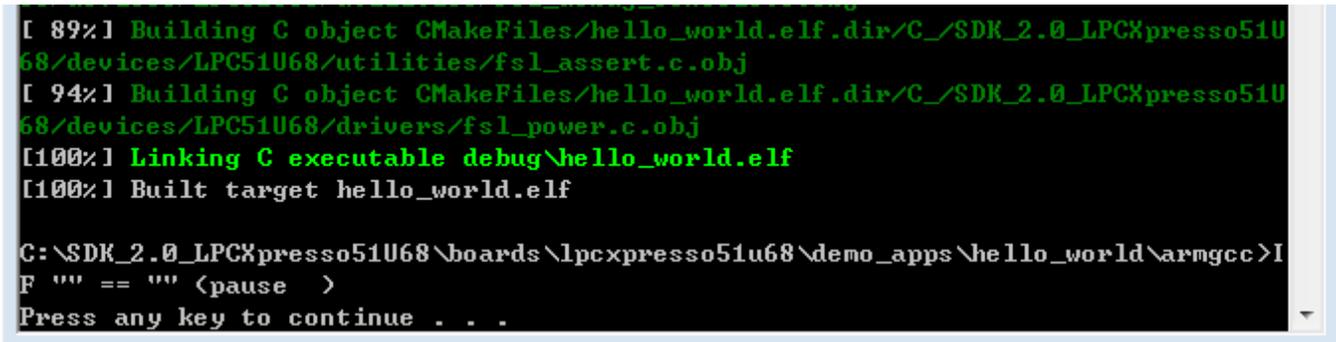

`<install_dir>/boards/<board_name>/<example_type>/<application_name>/armgcc`

For this example, the exact path is: `<install_dir>/examples/lpcxpresso51U68/demo_apps/hello_world/armgcc`

NOTE

To change directories, use the 'cd' command.

3. Type "build_debug.bat" on the command line or double click on the "build_debug.bat" file in Windows Explorer to perform the build. The output is shown in this figure:

```
[ 89%] Building C object CMakeFiles/hello_world.elf.dir/C:/SDK_2.0_LPCXpresso51U68/devices/LPC51U68/utilities/fsl_assert.c.obj
[ 94%] Building C object CMakeFiles/hello_world.elf.dir/C:/SDK_2.0_LPCXpresso51U68/devices/LPC51U68/drivers/fsl_power.c.obj
[100%] Linking C executable debug\hello_world.elf
[100%] Built target hello_world.elf

C:\SDK_2.0_LPCXpresso51U68\boards\lpcxpresso51u68\demo_apps\hello_world\armgcc>IF "" == "" (pause )
Press any key to continue . . .
```

Figure 22. hello_world demo build successful

5.3 Run an example application

This section describes steps to run a demo application using J-Link GDB Server application. To perform this exercise, two things must be done:

- Make sure that:
 - You have a standalone J-Link pod that is connected to the debug interface of your board. Note that some hardware platforms require hardware modification in order to function correctly with an external debug interface.

After the J-Link interface is configured and connected, follow these steps to download and run the demo applications:

1. Connect the development platform to your PC via USB cable between the Link2 USB connector and the PC USB connector. If you are connecting for the first time, allow about 30 seconds for the devices to enumerate.
2. Open the terminal application on the PC, such as PuTTY or TeraTerm, and connect to the debug serial port number (to determine the COM port number, see Appendix A). Configure the terminal with these settings:
 - a. 115200 or 9600 baud rate, depending on your board (reference BOARD_DEBUG_UART_BAUDRATE variable in board.h file)
 - b. No parity
 - c. 8 data bits
 - d. 1 stop bit

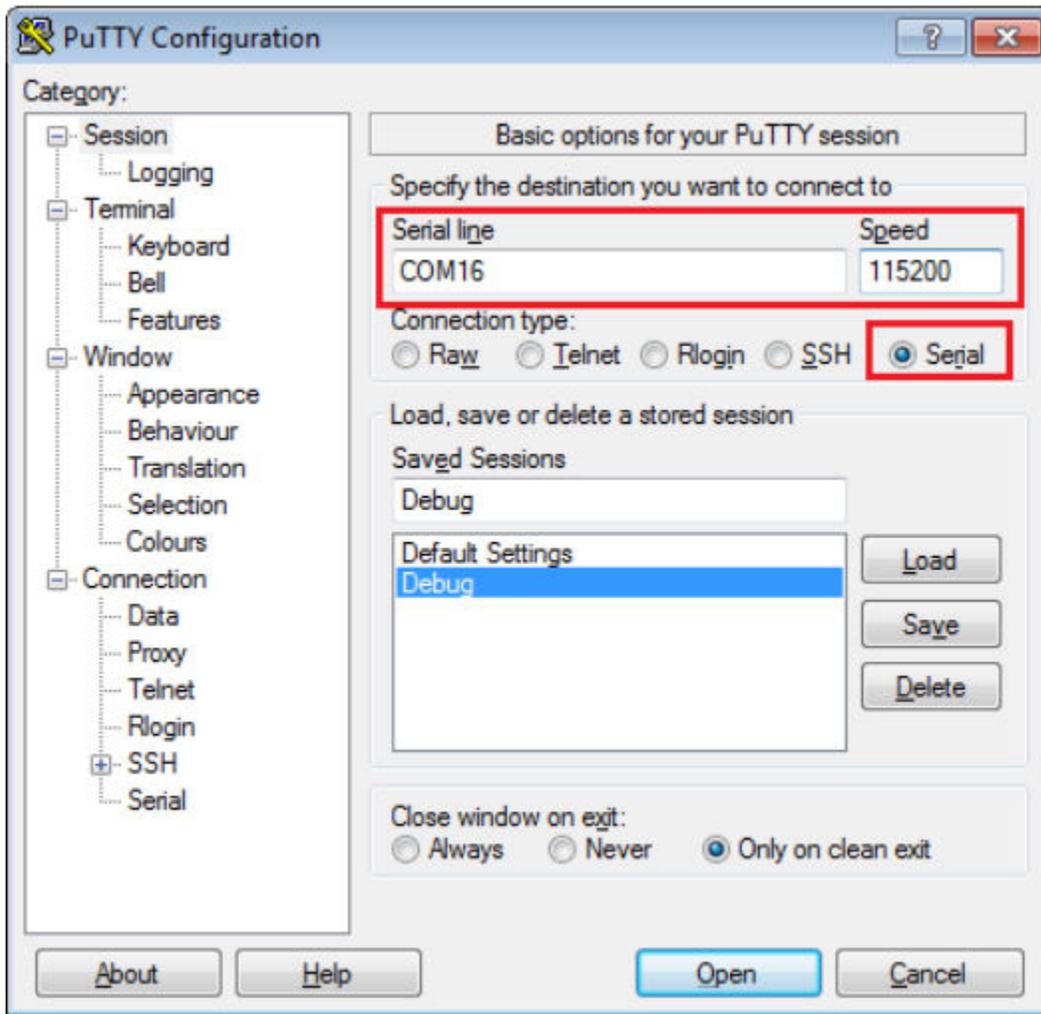

Figure 23. Terminal (PuTTY) configurations

3. Open the J-Link GDB Server application. Assuming the J-Link software is installed, the application can be launched by going to the Windows operating system Start menu and selecting “Programs -> SEGGER -> J-Link <version> J-Link GDB Server”.
4. Modify the settings as shown below. The target device selection chosen for this example is the LPC51U68
5. After it is connected, the screen should resemble this figure:

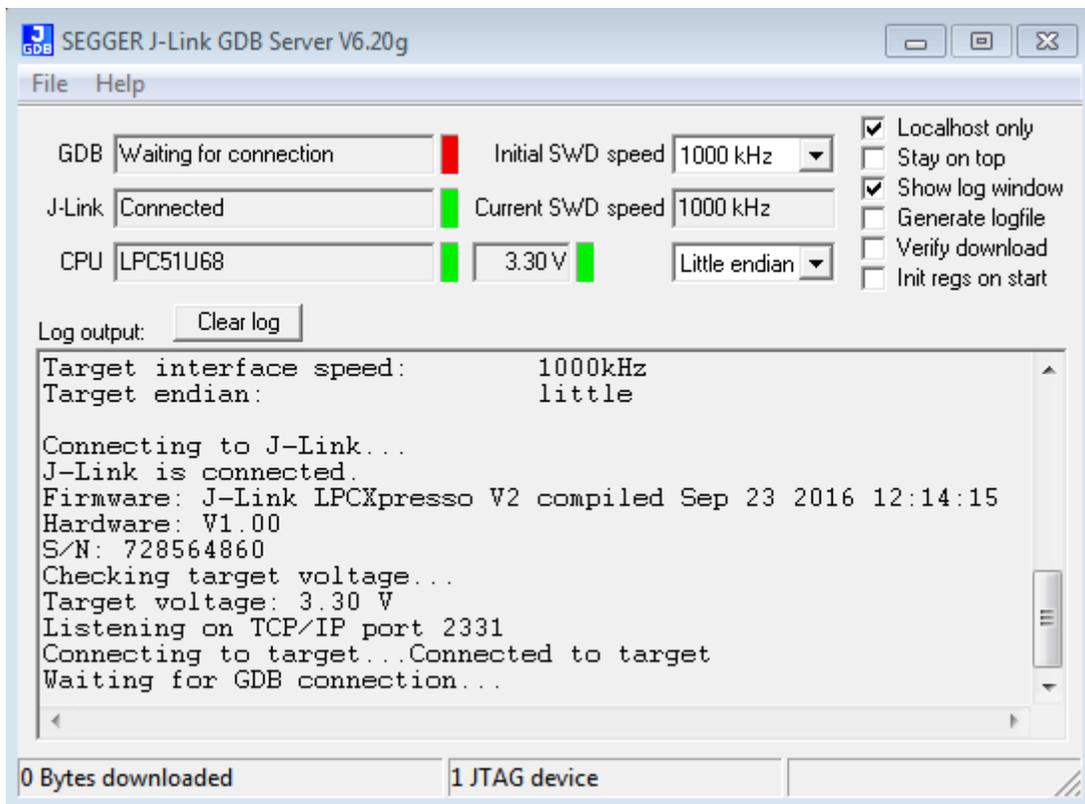

Figure 24. SEGGER J-Link GDB Server screen after successful connection

6. If not already running, open a GCC ARM Embedded tool chain command window. To launch the window, from the Windows operating system Start menu, go to “Programs -> GNU Tools ARM Embedded <version>” and select “GCC Command Prompt”.

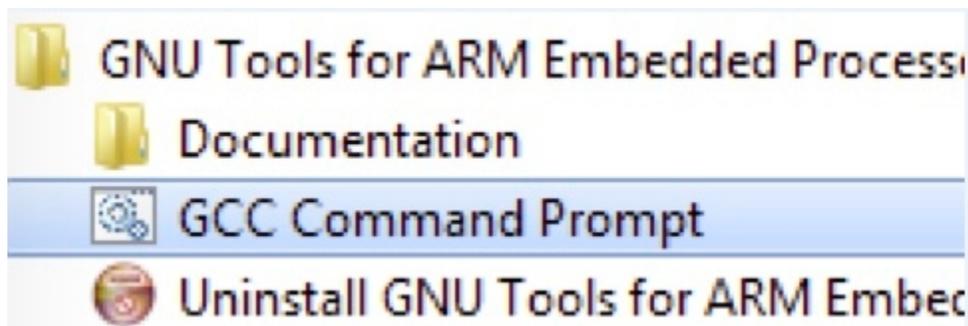

Figure 25. Launch command prompt

7. Change to the directory that contains the example application output. The output can be found in using one of these paths, depending on the build target selected:

`<install_dir>/boards/<board_name>/<example_type>/<application_name>/armgcc/debug`

`<install_dir>/boards/<board_name>/<example_type>/<application_name>/armgcc/release`

For this example, the path is:

`<install_dir>/boards/lpcxpresso51U68/demo_apps/hello_world/armgcc/debug`

8. Run the command “arm-none-eabi-gdb.exe <application_name>.elf”. For this example, it is “arm-none-eabi-gdb.exe hello_world.elf”.

```

Administrator: C:\windows\system32\cmd.exe - arm-none-eabi-gdb.exe hello_world.elf

C:\SDK_2.0_LPCXpresso51U68\boards\lpcxpresso51u68\demo_apps\hello_world\armgcc\d
ebug>arm-none-eabi-gdb.exe hello_world.elf
GNU gdb (GNU Tools for ARM Embedded Processors 6-2017-q2-update) 7.12.1.20170417

For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from hello_world.elf...done.
(gdb)

```

Figure 26. Run arm-none-eabi-gdb

9. Run these commands:
 - a. "target remote localhost:2331"
 - b. "monitor reset"
 - c. "monitor go"
 - d. "monitor halt"
 - e. "load"
 - f. "monitor reg pc=(0x4)"
 - g. "monitor reg msp=(0x0)"
10. The application is now downloaded and halted at the reset vector. Execute the "monitor go" command to start the demo application.

The hello_world application is now running and a banner is displayed on the terminal. If this is not true, check your terminal settings and connections.

```

COM3 - PuTTY

Hello World!

```

Figure 27. Text display of the hello_world demo

6 Run a demo using MCUXpresso IDE

NOTE

Ensure that the MCUXpresso IDE toolchain is included when generating the MCUXpresso SDK Package.

This section describes the steps required to configure MCUXpresso IDE to build, run, and debug example applications. The hello_world demo application targeted for the LPCXpresso51U68 hardware platform is used as an example, though these steps can be applied to any example application in the MCUXpresso SDK.

6.1 Select the workspace location

Every time MCUXpresso IDE launches, it prompts the user to select a workspace location. MCUXpresso IDE is built on top of Eclipse, which uses workspace to store information about its current configuration, and in some use cases, source files for the projects in the workspace. The location of the workspace can be anywhere, but it is recommended that the workspace be outside of the MCUXpresso SDK tree.

6.2 Build a non-example application

To build an example application, follow these steps.

1. Drag and drop the SDK zip file into the “Installed SDKs” view to install an SDK. In the window that appears, click the “OK” button and wait until the import has finished.

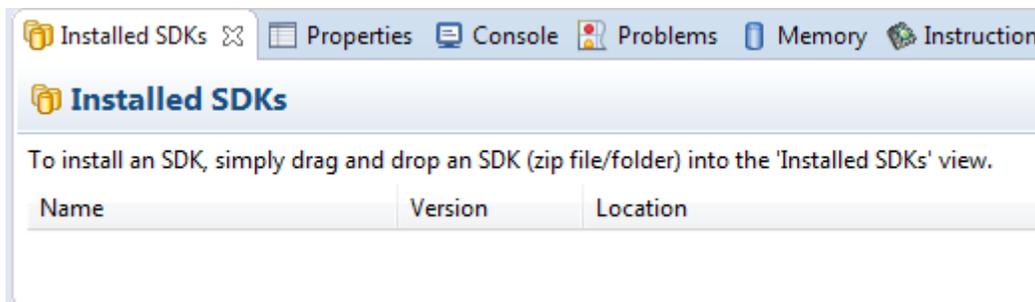

Figure 28. Install an SDK

2. On the *Quickstart Panel*, click “Import SDK example(s)...”.

Figure 29. Import an SDK example

3. In the window that appears, expand the "LPC51U68" folder and select "LPC51U68" . Then, select "lpcxpresso51U68" and click the "Next" button.

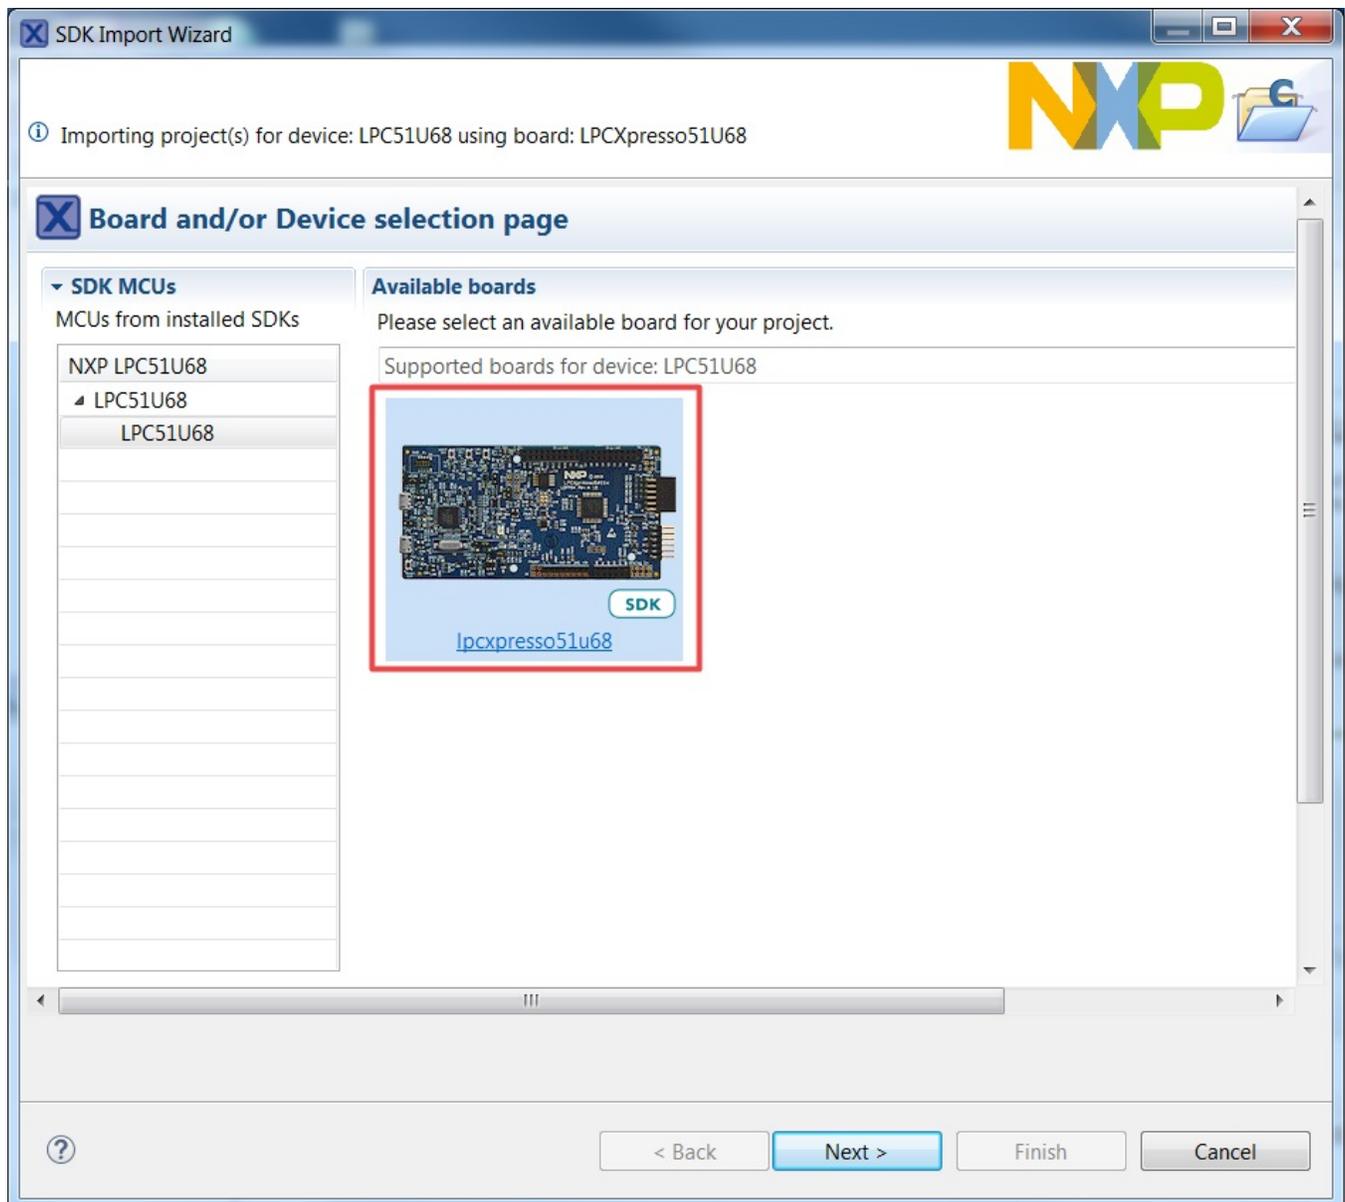

Figure 30. Select LPCXpresso51U68 board

4. Expand the “demo_apps” folder and select “hello_world”. Then, click the "Next" button.

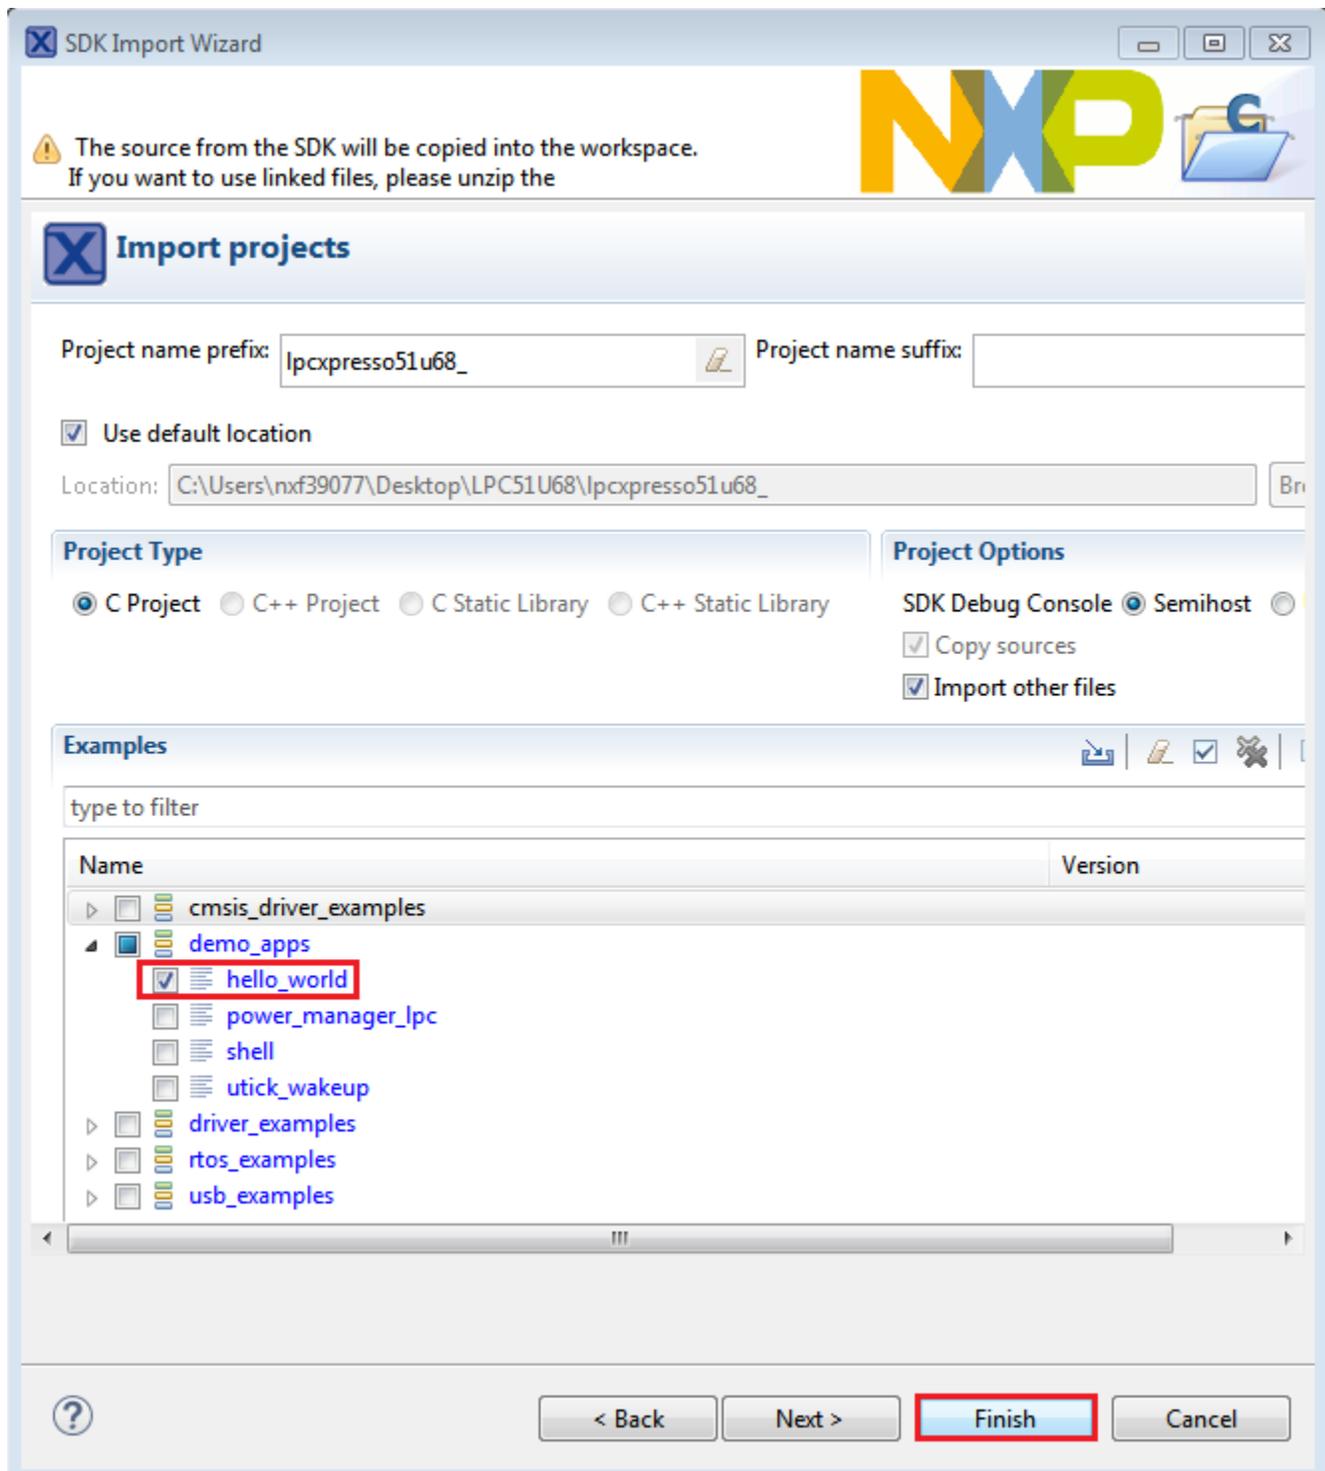

Figure 31. Select "hello_world"

5. Ensure the option “Redlib: Use floating point version of printf” is selected if the cases print floating point numbers on the terminal (for demo applications such as adc_basic, adc_burst, adc_dma, and adc_interrupt). Otherwise, there is no need to select it. Click the “Finish” button.

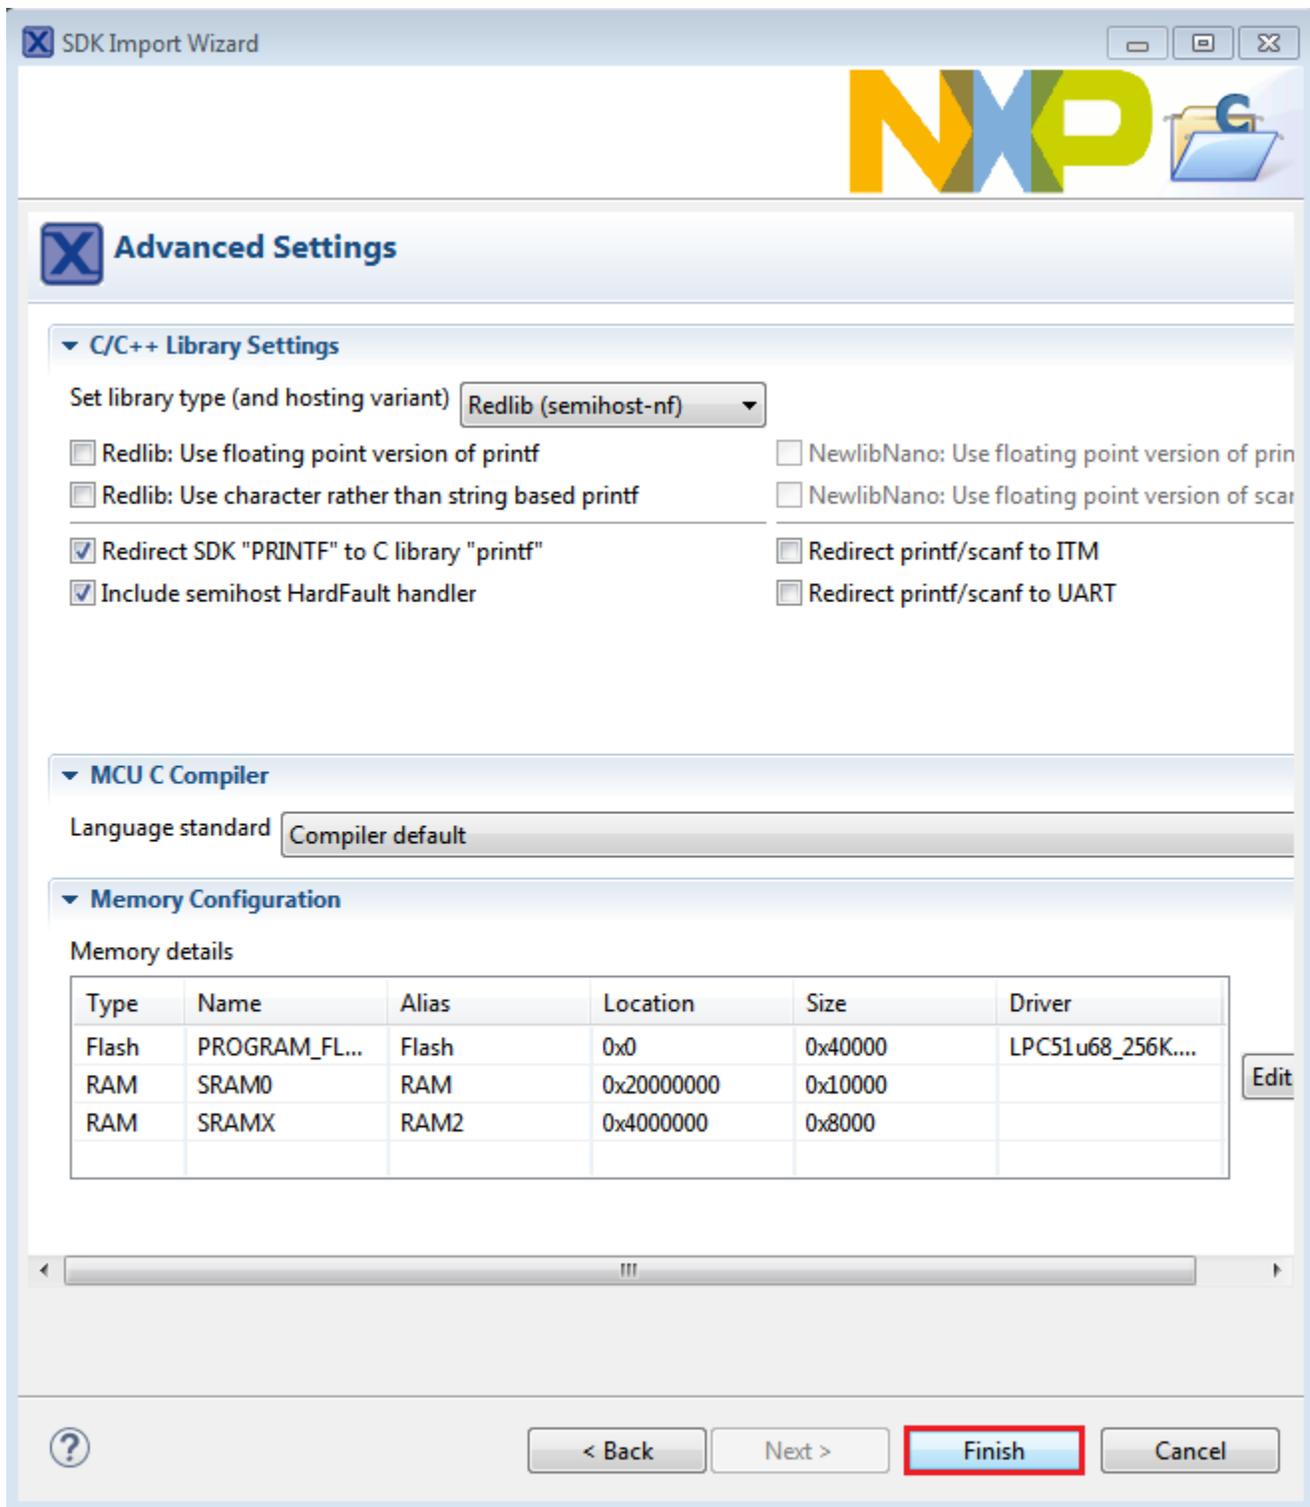

Figure 32. Select "User floating print version of printf"

6.3 Run a non-example application

For more information on debug probe support in the MCUXpresso IDE v10.1.0, visit community.nxp.com.

To download and run the application, perform these steps:

1. Reference the table in Appendix B to determine the debug interface that comes loaded on your specific hardware platform. For LPCXpresso boards, install the DFU jumper for the debug probe, then connect the debug probe USB connector.
2. Open the terminal application on the PC, such as PuTTY or TeraTerm, and connect to the debug serial port number (to determine the COM port number, see Appendix A). Configure the terminal with these settings:
 - a. 115200 or 9600 baud rate, depending on your board (reference BOARD_DEBUG_UART_BAUDRATE variable in board.h file)
 - b. No parity
 - c. 8 data bits
 - d. 1 stop bit

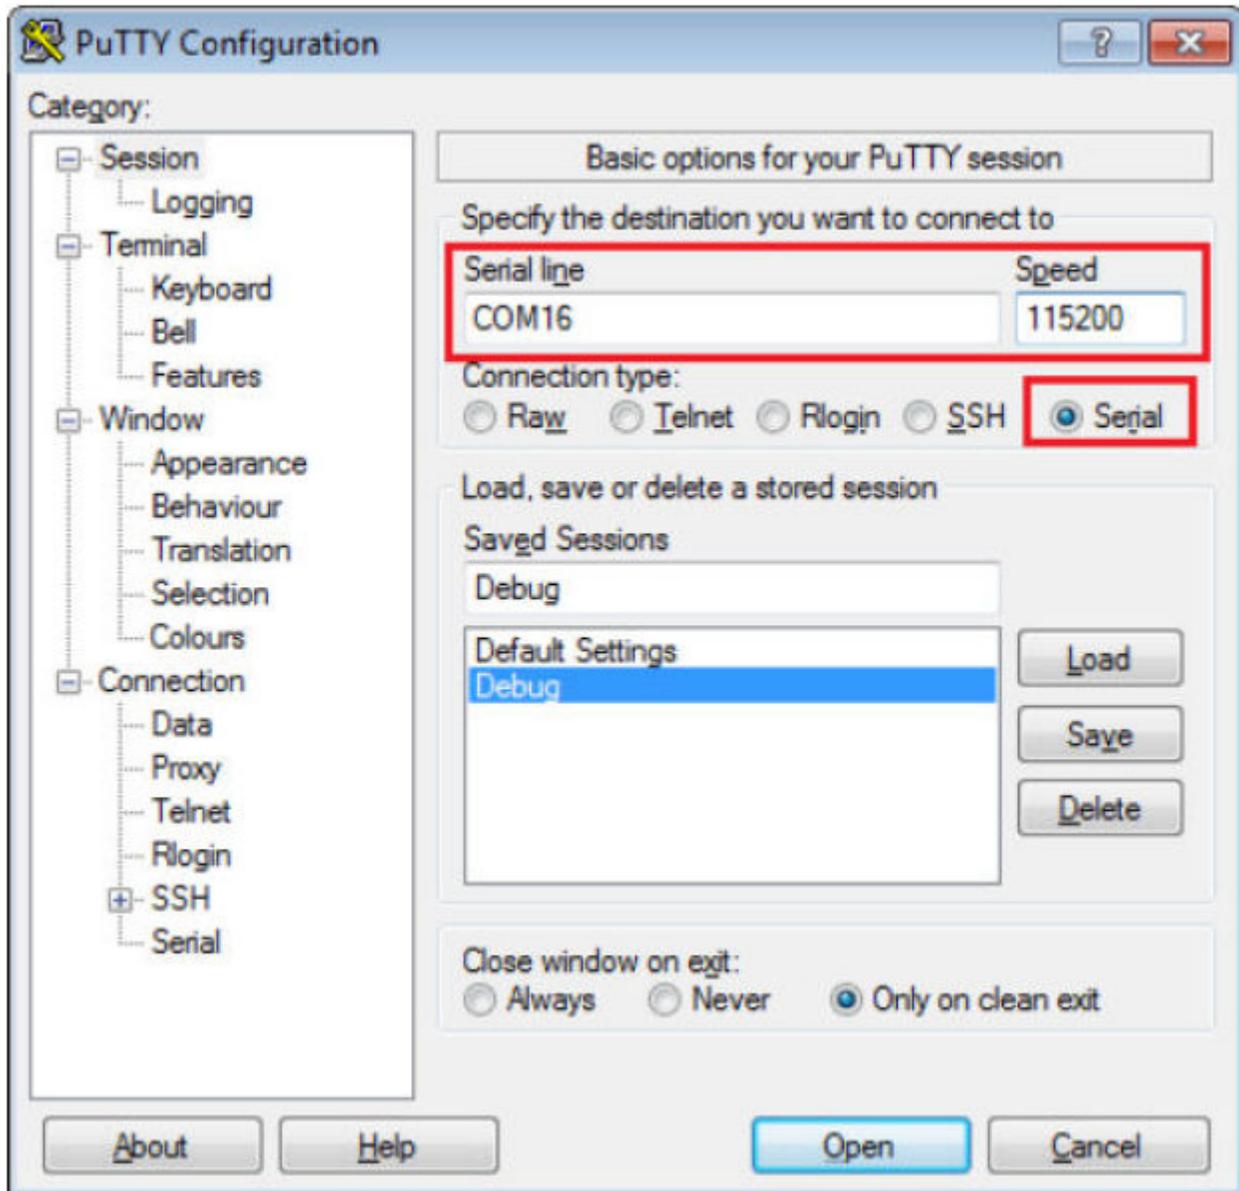

Figure 33. Terminal (PuTTY) configurations

3. On the *Quickstart Panel*, click on "Debug 'lpcxpresso51U68_demo_apps_hello_world' [Debug]".

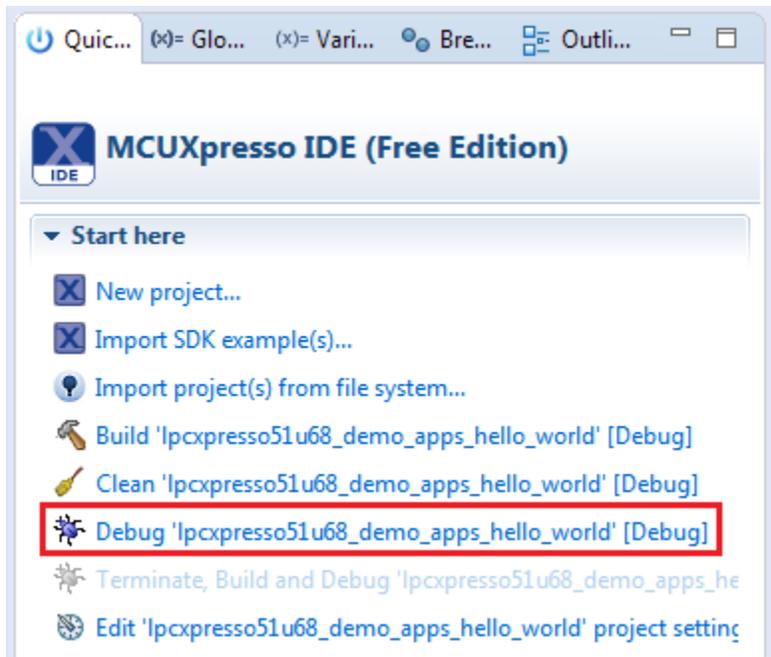

Figure 34. Debug "hello_world" case

4. The first time you debug a project, the Debug Emulator Selection Dialog is displayed, showing all supported probes that are attached to your computer. Select the probe through which you want to debug and click the “OK” button. (For any future debug sessions, the stored probe selection is automatically used, unless the probe cannot be found.)

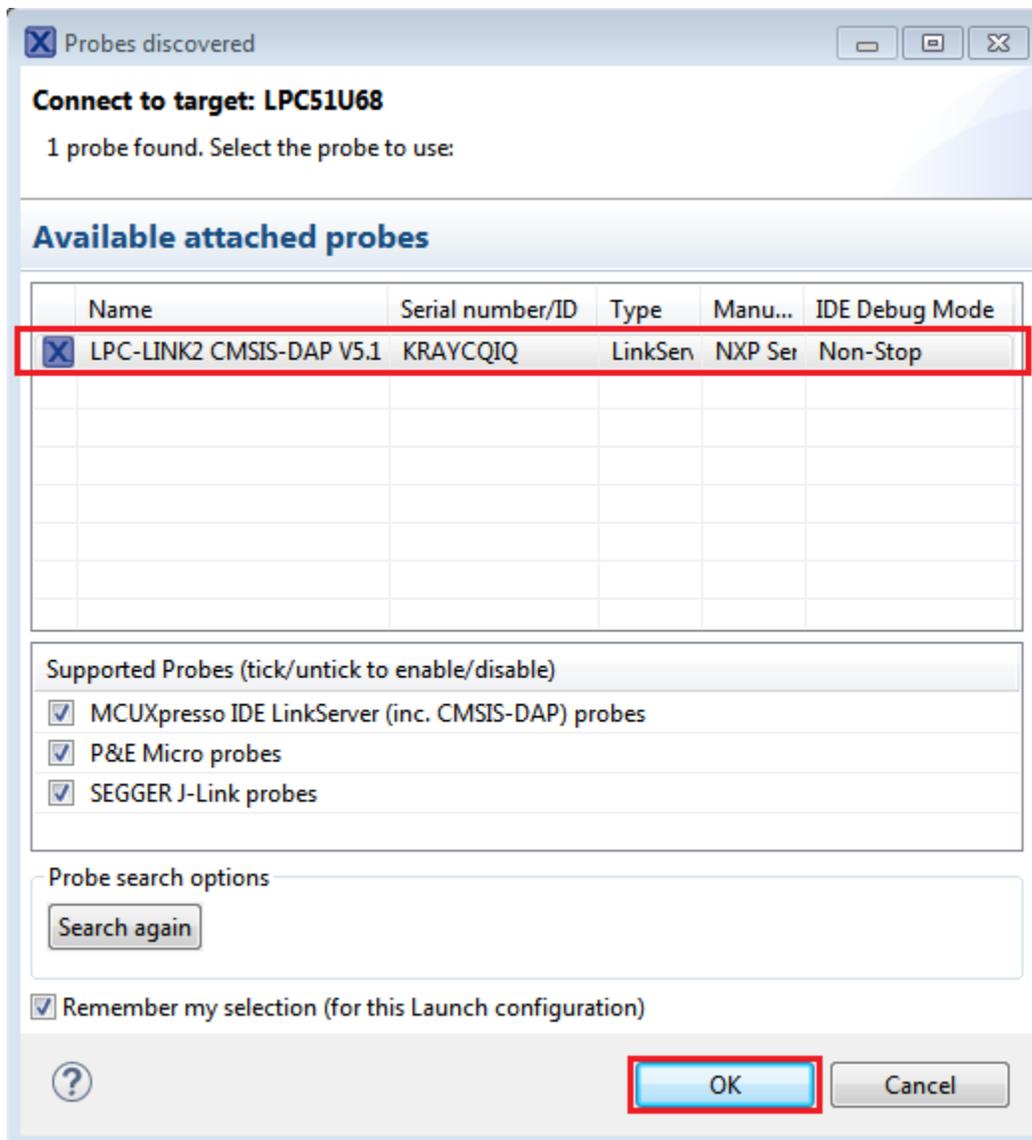

Figure 35. Attached Probes: debug emulator selection

- The application is downloaded to the target and automatically runs to main():

Run a demo using MCUXpresso IDE

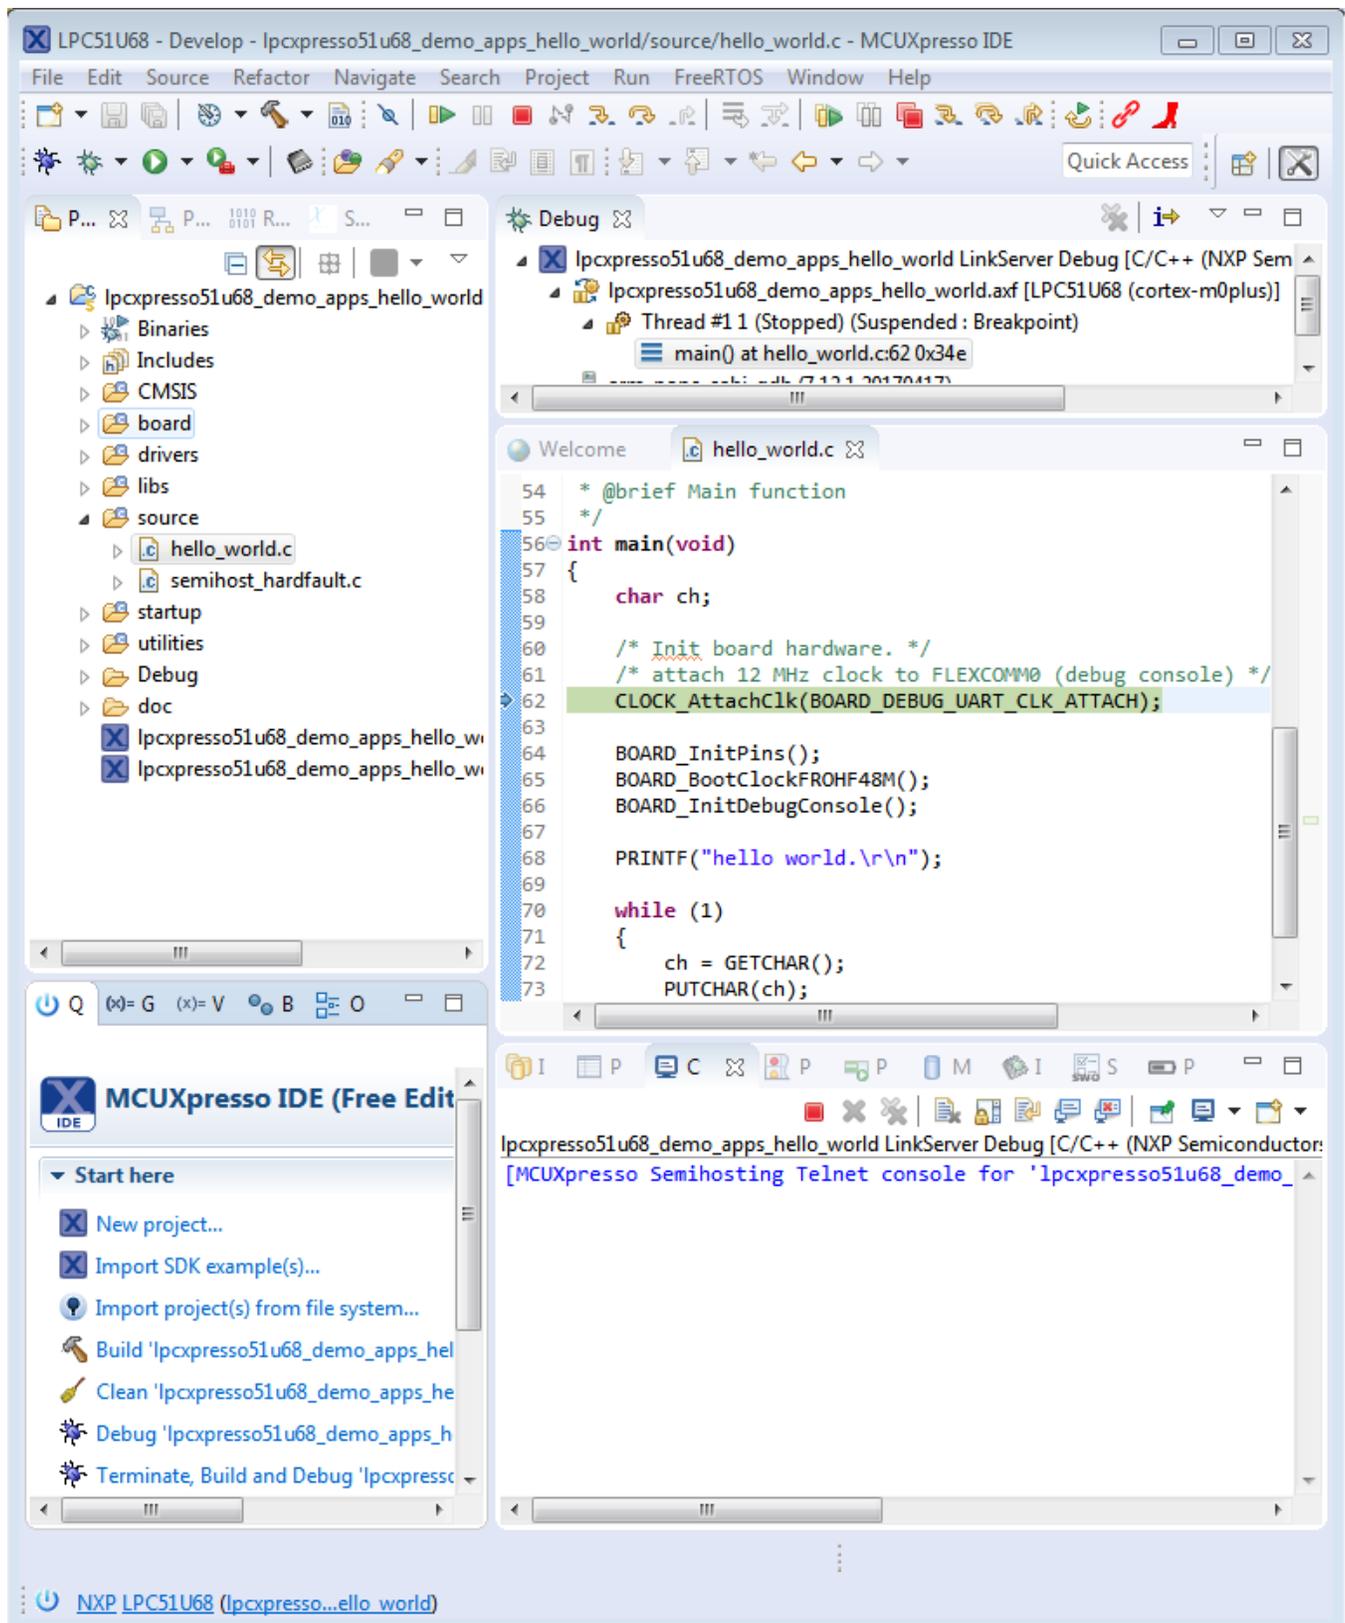

Figure 36. Stop at main() when running debugging

6. Start the application by clicking the "Resume" button.

Figure 37. Resume button

The hello_world application is now running and a banner is displayed on the terminal. If this is not the case, check your terminal settings and connections.

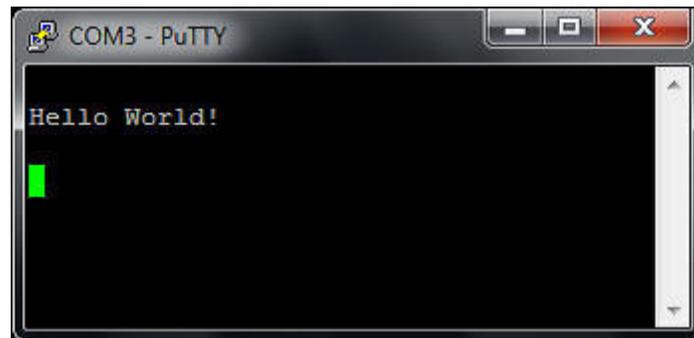

Figure 38. Text display of the hello_world demo

7 MCUXpresso Config Tools

MCUXpresso Config Tools can help configure the processor and generate initialization code for the on chip peripherals. The tools are able to modify any existing example project, or create a new configuration for the selected board or processor. The generated code is designed to be used with MCUXpresso SDK version 2.x.

The MCUXpresso Config Tools consist of the following:

Pins tool for configuration of pin routing and pin electrical properties.

Clock tool for system clock configuration.

Project Cloner allows creation of the standalone projects from SDK examples.

MCUXpresso Config Tools can be accessed in the following products:

- **Integrated** in the MCUXpresso IDE. See new perspectives allowing to configure peripherals directly in the IDE.
- **Standalone version** available for download from www.nxp.com. Recommended for customers using IAR Embedded Workbench, Keil MDK μ Vision, or Arm GCC.
- **Online version** available on mcuxpresso.nxp.com. Recommended to do a quick evaluation of the processor or use the tool without installation.

Each version of the product contains a specific “Quick Start Guide” document that can help start your work.

8 MCUXpresso IDE New Project Wizard

MCUXpresso IDE features a new project wizard. The wizard provides functionality for the user to create new projects from the installed SDKs (and from pre-installed part support), offers the flexibility to select/change many builds, includes a library, and provides source code options. The source code is organized as software components, categorized as driver, utilities, and middleware.

To use the wizard, start the MCUXpresso IDE. This is located in the *QuickStart Panel* at the bottom left of the MCUXpresso IDE window. Select the “New project” option, shown in the below figure.

Figure 39. MCUXpresso IDE Quickstart Panel

For more details of the usage of new project wizard, see the “MCUXpresso_IDE_User_Guide.pdf” in the MCUXpresso IDE installation folder.

9 Appendix A - How to determine COM port

This section describes the steps necessary to determine the debug COM port number of your NXP hardware development platform.

1. To determine the COM port, open the Windows operating system Device Manager. This can be achieved by going to the Windows operating system Start menu and typing “Device Manager” in the search bar, as shown below:

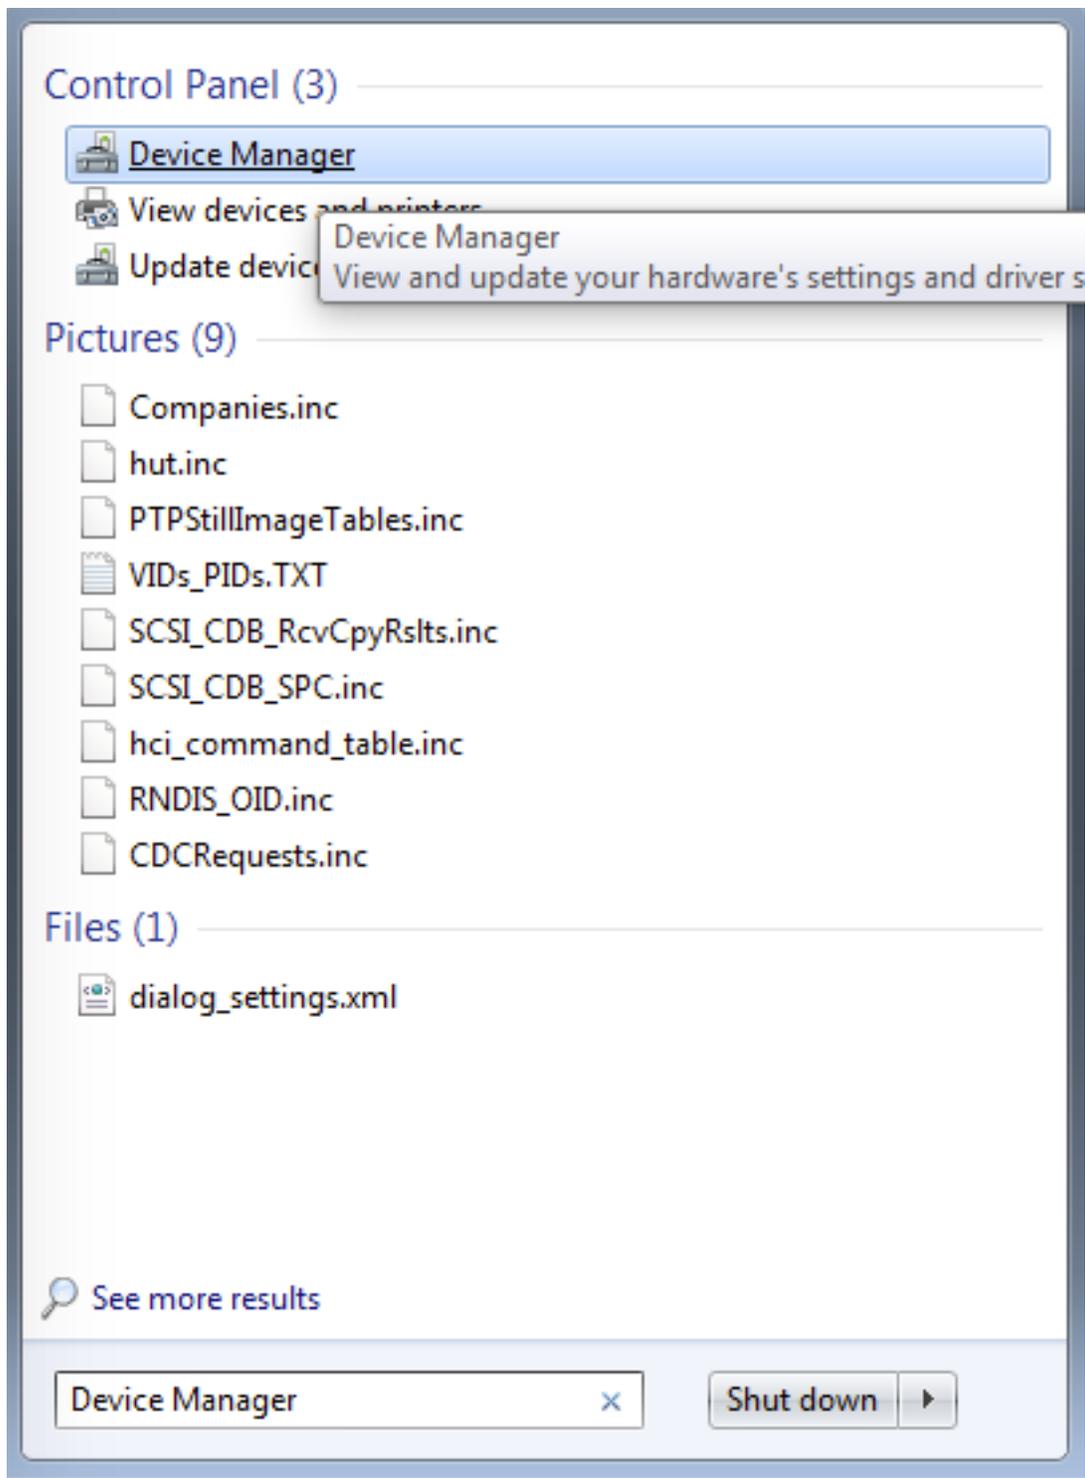

Figure 40. Device manager

2. In the Device Manager, expand the “Ports (COM & LPT)” section to view the available ports. Depending on the NXP board you’re using, the COM port can be named differently:
 - a. LPC-Link2

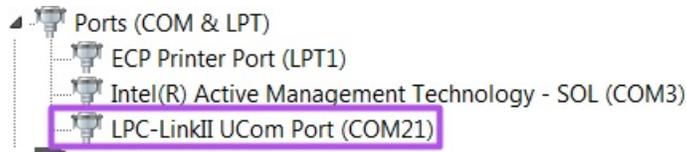

Figure 41. LPC-Link2

10 Appendix B - Default debug interfaces

The MCUXpresso SDK supports various hardware platforms that come loaded with a variety of factory programmed debug interface configurations. The following table lists the hardware platforms supported by the MCUXpresso SDK, their default debug interface, and any version information that helps differentiate a specific interface configuration.

NOTE

The 'OpenSDA details' column of the following table is not applicable to LPC.

Table 1. Hardware platforms supported by SDK

Hardware platform	Default interface	OpenSDA details
FRDM-K22F	CMSIS-DAP/mbed/DAPLink	OpenSDA v2.1

11 Appendix C - Updating debugger firmware

11.1 Updating LPCXpresso board firmware

The LPCXpresso hardware platform comes with a CMSIS-DAP-compatible debug interface (known as Link2). This firmware in this debug interface may be updated using the host computer utility called LPCScript. This typically used when switching between the default debugger protocol (CMSIS-DAP) to SEGGER J-Link, or for updating this firmware with new releases of these. This section contains the steps to re-program the debug probe firmware.

NOTE

If MCUXpresso IDE is used and the jumper making DFULink is installed on the board (JP5 on some boards, but consult the board user manual or schematic for specific jumper number), Link2 debug probe boots to DFU mode, and MCUXpresso IDE automatically downloads the CMSIS-DAP firmware to the probe before flash memory programming (after clicking the "Debug" button). Using DFU mode ensures most up-to-date/compatible firmware is used with MCUXpresso IDE.

NXP provides the LPCScript utility, which is the recommended tool for programming the latest versions of CMSIS-DAP and J-Link firmware onto LPC-Link2 or LPCXpresso boards. The utility can be downloaded from www.nxp.com/lpcutilities.

These steps show how to update the debugger firmware on your board for Windows operating system. For Linux OS, follow the instructions described in LPCScript user guide (www.nxp.com/lpcutilities, select LPCScript, then select documentation tab).

1. Install the LPCScript utility.
2. Unplug the board's USB cable.
3. Make the DFU link (install the jumper labelled DFULink).
4. Connect the probe to the host via USB (use Link USB connector).
5. Open a command shell and call the appropriate script located in the LPCScript installation directory (<LPCScript install dir>).
 - a. To program CMSIS-DAP debug firmware: <LPCScript install dir>/scripts/program_CMSIS
 - b. To program J-Link debug firmware: <LPCScript install dir>/scripts/program_JLINK
6. Remove DFU link (remove the jumper installed in step 3).
7. Re-power the board by removing the USB cable and plugging it again.
